INTRODUCTION

This guide describes the installation, configuration, and use, of the Spectra Vail[®] software. The guide helps you to optimize the software for best performance and data security.

This guide is intended for data center administrators and operators who maintain and operate object storage systems. This guide assumes a familiarity with large-scale data storage architecture, with installing, configuring, and use of data storage software, as well as with various data storage mediums, including cloud, disk, and tape.

RELATED PUBLICATIONS

Vail Online Help

This user guide is also available in web form, and can be accessed by clicking the question mark (?) icon in the Vail management console, or by entering the below URL into a web browser.

Spectra Logic Vail Release Notes

The Spectra Vail Software Releases Notes on the <u>Support Portal website</u> provide the most up-todate information about the Spectra Vail application, including information about the latest software releases and documentation updates.

Spectra Logic BlackPearl Systems

The following documents related to the BlackPearl[®] Nearline Gateway and BlackPearl NAS systems are available from the Documentation screen on the BlackPearl user interface, and on the *Support Portal website*, at: support.spectralogic.com.

The <u>Spectra BlackPearl Nearline Gateway User Guide</u> provides detailed information about configuring, using, and maintaining your BlackPearl Nearline Gateway system.

The <u>Spectra BlackPearl Nearline Gateway S3 API Reference</u> provides information on understanding and using the Spectra DS3 API.

The <u>BlackPearl NAS User Guide</u> provides detailed information about configuring, using, and maintaining your BlackPearl NAS system.

Spectra Logic Tape Libraries

User Guides for Spectra Logic tape libraries are posted on the *Support Portal website*.

WHAT'S NEW

The Vail application is updated to Vail 3.2.0, which brings with it the following new features:

BlackPearl Volume Pool Storage Improvements

When creating volume pool storage in the Vail management console, you now select an existing storage pool on the BlackPearl system, and the Vail application automatically creates the required volume and share with the necessary parameters required by the Vail application. Additionally, if you delete the volume pool storage endpoint, the volume and share are automatically deleted.

Virtual Path and Region Support for S3 Other Storage

The Vail application now supports specifying a region when configuring non-AWS, S3 Other cloud storage in the Vail management console. Additionally you can now select to use either virtual-path or host style addressing when creating S3 Other storage.

LifeCycle Filtering

The Vail lifecycle design is updated to allow for filtering of metadata in lifecycles. Metadata filters allow you to place or delete objects by schedule, by version, or by including or excluding objects based on name or object tag, allowing you to group objects based on metadata for more efficient storage.

VM Storage Creation Enhancements

The Vail application now allows you to configure VM storage by selecting a block device as a storage target. This allows you to configure a storage class and additional options when creating VM storage.

Enhanced Compatibility with Veeam Archive Software

The Vail application is updated to support additional VeeamTM S3 commands as well as a script that can be used to identify objects whose latest version is a delete marker.

Set Maximum Clone Processing Destinations using API Commands

The Vail application now supports both reading and setting the maximum number of clone processing destinations. These commands also provide a way to disable all secondary clone creation.

Limit Number of Storage Destinations Processing Clones

The Vail application now features a configurable limit to the number of storage destinations that are actively processing clones, which improves stability and performance under heavy load.

Limit Status Checks for GET Jobs

The Vail application now limits the number of GET job status checks with a 30 second delay between checks to avoid a burst of simultaneous requests.

Configurable Fetch Counts to Limit Stage Pack Creation

The Vail application now allows you to set the number of staging jobs created to prefetch packs. Contact Spectra Logic Technical Support for assistance in configuring this setting.

Edit BlackPearl Volume Storage Improvements

The Vail application now allows you to change the parameters of BlackPearl volume storage without requiring the application to restart.

Added Support for Paging Parameters in Bucket Listings

The Vail application now supports paging parameters when listing buckets in the API.

Added Support for GetObject Response Header Overrides

The Vail application now supports alternate headers included in the response for a GetObject or HeadObject request.

Enhanced Object Locking Controls

The Vail application now allows you to configure the type and maximum duration of an object lock.

Improved Throttling for Clone Retry Processing

The Vail application now processes the entire list of pending clones when resuming after a throttling limit is reached, instead of starting over at the beginning.

Volume Storage Quota Support

When creating or editing BlackPearl volume storage, you are now able to specify the percentage of disk space allowed for the volume.

IAM Group Reporting and Policy Permission Updates

The Vail application now allows you to view all users within a specific IAM group, as well as displaying and managing IAM group policies. Each IAM group can have one or more policies attached to it. Each one of those policies is managed individually.

Disable IAM Account

You are now able to disable an IAM account using the Vail management console.

New API Commands

The Vail application features new API commands that allow you to list the contents of a pack, and to delete or migrate a pack. You are now also able to add S3 keys, and AWS access and secret key pairs to a user using the API, as well as retrieving information about a specified IAM access key.

Vail Database Enhancements

The Vail application now uses the Vail database more efficiently to improve stability and performance under heavy load.

Vail Application Logging Improvements

The Vail application now processes logs more efficiently, allowing for faster log set creation.

Messaging Improvements

The Vail application is updated with new and improved error and informational messaging.

CHAPTER 1 - UNDERSTANDING THE VAIL APPLICATION

This chapter describes the concepts behind the Vail application and how it works with various storage technologies and mediums.

VAIL APPLICATION FEATURES

The Spectra Logic Vail application is an advanced data management system providing a comprehensive solution for managing, protecting, and accessing data across hybrid cloud and on-premises environments. Vail integrates various data storage technologies to streamline data workflows and ensure efficient data management and protection.

The major Spectra Vail application features include:

- Global access to a single name space, which allows for seamless data management across various locations and storage types.
- Command, control, and monitoring using a single management point, which simplifies the management process.
- S3-compatible interface for easy integration with applications and services using the S3 API.
- Data stored on-premises using flash, disk, tape, or third party storage.
- Data stored to and synchronized from cloud storage, allowing for flexible data management options. The Vail application supports cloud storage providers such as Amazon Web Services[®], Microsoft[®] Azure[®], Google Cloud Storage[®], and others.
- Once an object is uploaded anywhere in the Vail sphere, it is immediately available to anyone who is connected to the sphere, promoting collaboration and efficient data access.
- Rich policy engine provides time-based data placement for each storage type and geographic location, allowing for efficient data management and compliance with data governance policies.
- Unlimited number of data storage sites, offering scalability to meet growing data storage and security needs. Migrating data to multiple geographic locations around the world allows for increased data protection in the event of natural disasters or virus attacks, which normally would impact where and how a company accesses its data.
- Local or cloud-based control. Local control uses a standalone BlackPearl S3 system without the need for cloud services, and includes support for multi-factor authentication. Cloud control allows organizations to log in from anywhere in the world to control and monitor data movement, enhancing accessibility and operational flexibility.

Other features of the Vail application include:

- A high-speed cache on the BlackPearl S3 solution which enhances performance for frequently accessed data.
- System monitoring and tools to view capacity information and performance metrics, ensuring optimal data management.

- Supports Cross-Origin Resource Sharing (CORS) for S3 commands, enhancing web integration capabilities.
- The Vail application can use a HotPair BlackPearl system running BlackPearl OS 5.7.x or later, enhancing data protection and availability.
- An improved bucket object display includes information about the total number of objects, object size, and total size of all objects in the bucket, all within the Vail management console.
- Supports S3 bucket notifications for various bucket events and S3 tagging of objects, allowing IAM policies to use tags instead of prefixes.
- Includes the BlackPearl Embedded Dashboard for controlling common features of the BlackPearl system without accessing its user interface.

General Use Cases include:

- **Backup and Archive:** Serves as a target for backup applications and long-term data archiving.
- **Data Replication:** Enables replication of data from other storage environments, increasing data availability and redundancy.
- **Disaster Recovery:** Supports robust backup and disaster recovery solutions. Data can be migrated to multiple geographic locations to protect against natural disasters or cyber-attacks.
- **Data Archiving:** Provides cost-effective long-term archiving solutions.
- **Multi-Tenancy:** Suitable for environments requiring isolated data management within a shared infrastructure.

UNDERSTANDING BLACKPEARL STORAGE

The Vail application uses a BlackPearl S3 solution as endpoint storage, which provides scalable, efficient, and flexible storage across multiple mediums, including disk, tape, and cloud. Data transfer operations on a BlackPearl system use the standard S3 interface, appearing to applications as AWS S3 storage.

The BlackPearl S3 solution uses a system cache to enhance performance for frequently accessed data and uses the Advanced Bucket Management policy engine to manage data movement between different storage targets based on defined rules. The BlackPearl S3 solution also supports integration with cloud storage providers, which allows for intelligent object placement and retrieval.

BlackPearl endpoint storage can be used as a path to tape storage. The BlackPearl S3 solution uses the S3-Glacier interface to store data on tape, offering a seamless backup and restore process using standard S3 commands.

Types of BlackPearl Storage

The Vail application supports using both bucket storage and NAS storage provided by a BlackPearl S3 solution, each allowing for different use cases and operational needs.

- BlackPearl bucket storage is designed for object storage, leveraging the S3 protocol, which is ideal for managing unstructured data such as backups, archives, and large data sets. This storage model is highly scalable, allowing for the efficient handling of large volumes of data with support for multipart uploads, object versioning, and lifecycle policies to automate data management tasks. Users interact with BlackPearl bucket storage using APIs, enabling seamless integration with various applications and workflows that require object storage.
- BlackPearl NAS share storage is designed for direct file storage, providing a more traditional approach to storing and accessing data. NAS share storage supports common file protocols like SMB and NFS, making it suitable for environments where users and applications need shared access to files and directories. NAS share storage is particularly useful for collaborative work, as multiple users can read and write to the same files simultaneously. NAS share storage is often used for storing documents, media files, and other structured data that benefit from hierarchical organization and direct file access.

UNDERSTANDING VAIL CLOUD STORAGE

The Vail application uses cloud storage by seamlessly integrating with various cloud services, allowing you to manage and move data efficiently. The Vail application uses predefined policies and lifecycle rules to automate data migration, replication, and tiering within the cloud. This allows data to be optimally stored, balancing cost and accessibility.

The Vail application provides a unified management interface that allows you to oversee and control your data across different cloud environments. Data is stored in Vail buckets, which can link to cloud storage, enabling flexible and scalable data management. The Vail software automates the process of moving data to different cloud storage tiers based on access frequency and other criteria, which allows for efficient use of cloud resources and cost savings.

Additionally, the Vail application supports object storage within the cloud, making it easy to store and retrieve large volumes of unstructured data. The integration with cloud storage services also enhances data durability and availability, leveraging the cloud's inherent redundancy and disaster recovery capabilities.

The Vail application supports bi-directional synchronization with cloud storage, allowing data to be synchronized between local BlackPearl buckets and cloud buckets. Any data placed in one location is automatically synchronized to the other location, facilitating seamless data access and management across different storage environments. This can be useful for distributed workflows where data needs to be accessed and processed in multiple locations.

The Vail application provides robust security measures to protect data during transfer to cloud targets. All network traffic between Vail nodes and cloud resources is secured using HTTPS with TLS encryption. This ensures that data is protected from unauthorized access during transit.

Vail Application with AWS Cloud Storage

The information below describes the features provided by Amazon AWS cloud storage when used with the Vail application.

- Bucket synchronization allows for seamless synchronization between AWS S3 buckets and Vail buckets. Synchronization occurs bi-directionally. This facilitates distributed and accelerated data ingestion by synchronizing data placed in an AWS bucket to a local Vail bucket and vice versa and allows you to apply AWS services to local data without permanently storing it in the cloud.
- The Vail application uses the multipart upload capabilities of AWS S3, which allows large objects to be uploaded in parts, with each part tracked to resume interrupted transfers seamlessly.
- AWS S3 supports immutable objects, preventing deletion during a specified retention period. The Vail application uses object locking so that objects stored in AWS S3 cloud storage comply with specified retention policies.

- AWS IAM policies are used for secure access and permissions management. AWS credentials (access keys and IAM roles) are used to authenticate and authorize access to S3 buckets.
- AWS S3 versioning is required for AWS buckets used with Vail, so that multiple versions of objects are maintained.
- AWS cloud storage supports creating lifecycle rules to transition objects between storage classes, such as moving infrequently accessed data to GLACIER or DEEP_ARCHIVE.
- Data security features include encrypting data using AWS Key Management Service (KMS) for secure key management, and using HTTPS and V4 authentication ensure data is protected in transit.

Vail Application with Microsoft Azure Cloud Storage Features

The information below describes the features provided by Microsoft Azure cloud storage when used with the Vail application.

- Data stored in Azure cloud pools is treated as native Azure objects, maintaining compatibility and allowing seamless access through Azure storage services.
- Azure cloud storage uses Azure block blobs for multipart uploads, determining the method based on object size. Multipart uploads on Azure do not provide a unique identifier. Part IDs must include a unique value in addition to the part number to prevent simultaneous uploads from interfering with each other.
- Vail object locking works with Azure immutable objects, allowing explicit control and expiration settings. The Vail application does not use Azure immutable storage settings directly, it manages immutable objects using special clone deletion processing.
- The Vail application uses the storage container shared secret key for authentication. Credentials must include permissions for deleting blobs and blob versions using Azure RBAC.
- Azure storage does not handle slashes and backslashes as ordinary characters, converting backslashes to slashes when writing blobs. Leading slashes and repeated slashes are ignored or compressed to a single slash respectively. The Vail application adjusts its behavior to accommodate these Azure storage constraints.

Note: Azure storage restricts user metadata keys to C# naming conventions, and unsupported characters in user metadata are not copied to Azure storage.

Vail Application with Google Cloud Storage

- Vail maps AWS storage classes to Google Cloud Storage tiers, but note that GLACIER and DEEP_ARCHIVE storage classes are not supported with Google Cloud Storage.
- The Vail application uses role-based authentication to connect to Google cloud storage.
- Google cloud storage supports multipart uploads using Google SDK, which simplifies and optimizes large uploads, using resumable upload to track the progress.

- Vail object locking works with immutable objects, allowing explicit control and expiration settings. The Vail application recognizes and handles locked objects, but does not use Google immutable storage settings directly.
- Data stored by the Vail application in Google Cloud storage is stored in packs, with each pack assigned a unique identifier. These packs are then listed in the pack list for the corresponding object version in the Vail application. The version ID and ETag are used to validate the data integrity of an object before it is retrieved and reconstructed.

UNDERSTANDING VAIL LIFECYCLES

A Vail lifecycle is a set of automated policies that manage the lifecycle of data from creation to deletion. These policies dictate how data is transitioned through various stages, such as moving data between different storage tiers based on age, access frequency, or other criteria, and eventually deleting data that is no longer needed. The purpose of implementing lifecycle policies is to optimize storage costs, improve data management efficiency, and provide compliance with regulatory and organizational data retention requirements.

Lifecycles are controlled using placement and deletion rules. These rules specify the conditions under which data is moved or deleted, such as after a certain period or if it has not been accessed for a specified duration. Administrators can set a specific time for lifecycle actions to minimize disruption to users and system performance. Logging and auditing features keep a record of all actions taken by the lifecycle policies, providing an audit trail for compliance and troubleshooting purposes.

By automating data management through well-defined lifecycle policies, organizations can ensure efficient storage resource use, data retention policy compliance, and data loss risk reduction.

Considerations for Placement Rules

When creating a Vail lifecycle placement rule, consider the below information to provide efficient and effective data management.

- Define the specific criteria for transitioning data between storage tiers based on factors such as the age of the data, access frequency, and data size. These criteria help you determine when and how data is moved from a higher-cost, high-performance tier to a more cost-effective, lower-performance tier, or even to archival storage. It is crucial to understand the characteristics and costs associated with each storage tier to optimize storage expenses while maintaining the necessary performance levels for your data.
- Consider the impact of data transitions on access and retrieval times. Data moved to an archival tier might result in longer retrieval times and potentially higher costs when accessed. Lifecycle rules should be designed in accordance with your organization data access patterns and compliance requirements.
- Define clear retention periods for different types of data to comply with legal and regulatory requirements. This includes setting rules for deleting data after it has been retained for a specified duration.

Additionally, Spectra Logic recommends testing the lifecycle placement rules in a controlled environment before applying them broadly. This helps to identify any unintended consequences and confirms that the rules function as expected, preventing potential disruptions in data availability or performance.

Considerations for Delete Rules

The primary goal of a delete rule is to automate the removal of data that is no longer needed, thereby optimizing storage costs and maintaining a clutter-free environment. When creating a Vail lifecycle delete rule, consider the below information to provide effective data management and compliance.

- Define the criteria that determine when data should be deleted, such as the age of the data, last access time, or specific metadata attributes. These criteria should align with the data retention policies and regulatory requirements of your organization for compliance with legal mandates and avoid unintentional loss of important data.
- Consider the retention periods for different types of data. Some data may need to be retained for longer periods due to regulatory requirements, legal holds, or business needs. It is crucial to ensure that these retention requirements are incorporated into your lifecycle delete rules to prevent premature deletion. Verify that data scheduled for deletion is not part of critical backup sets or disaster recovery plans, as its removal could impact the ability to restore important information.
- Consider the impact on data access and performance. Deleting large volumes of data may affect system performance or disrupt ongoing operations. Spectra Logic recommends scheduling delete operations during off-peak hours or in a staggered manner to minimize any potential impact.

Additionally, Spectra Logic recommends testing the lifecycle deletion rules in a controlled environment before applying them broadly. This helps to identify any unintended consequences and confirms that the rules function as expected, preventing potential disruptions in data availability or performance.

UNDERSTANDING OBJECT CLONES

An object clone is a duplicate version of object data stored in a different location than the original object. This allows for optimized access across the Vail sphere, as well as data redundancy and recovery purposes.

Each clone copy of an object is a copy of the object version data stored in a different storage target. The clone copy data structure includes the pool identifier and the encoded data. The data encoding method varies depending on the type of storage provided by each pool and the storage class assigned to the storage target.

The Vail application uses lifecycle rules to manage clone copies. Placement and Deletion rules specify where and how long the copies are stored. Lifecycle rules automate data placement and retention across storage locations in the Vail sphere.

A common use of clone copies involves creating immediate duplicates of objects in different storage locations. For example, a lifecycle policy can be configured to create a clone copy in AWS cloud storage immediately after an object is placed into an on-premise BlackPearl bucket. This allows for data availability in both local and cloud environments for enhanced data access, protection, and disaster recovery.

UNDERSTANDING VAIL BUCKETS

Vail buckets provide a versatile and scalable object storage solution. A Vail bucket is a top level component of Vail application platform, designed to streamline and unify data management across multiple storage environments, including on-premises and cloud-based systems. This integration allows organizations to create a cohesive data management strategy, leveraging the strengths of different storage systems while maintaining a unified view of their data.

You can create a Vail bucket and assign it a lifecycle to manage the placement, movement, and retention. Through automated rules, data can be tiered across different storage types based on access patterns, age, and other criteria, optimizing both cost and performance.

Vail buckets support bi-directional synchronization, allowing data to be mirrored between local storage and cloud targets, allowing for high availability and redundancy. This functionality is particularly advantageous for organizations implementing a hybrid or multicloud approach, as it provides data access and management across various storage locations.

Additionally, Vail buckets offer advanced features such as versioning, metadata management, and robust security controls, so that data is not only stored efficiently but also protected and easily accessible.

Considerations for Vail Bucket Creation

When creating a Vail lifecycle bucket, consider the below information to optimize data organization and bucket functionality.

- Plan a method to organize your data in the Vail bucket. Consider using a hierarchical structure with clear naming conventions to facilitate easy data retrieval and management. Plan for the use of metadata to tag and categorize data, which improves searchability and organization.
- Decide on versioning requirements for your data. Versioning allows you to maintain multiple versions of objects, which provides data protection against accidental deletions or modifications. If you chose to use versioning, object locking can be used, which allows you to protect the state of an object when the lock is applied.
- Decide on a data security strategy that includes using encryption, access controls, and bucket and object ownership permissions.
- Plan for data redundancy and disaster recovery. The Vail application supports bidirectional synchronization of buckets, allowing data to be mirrored between local and cloud storage targets.
- Verify compatibility with your existing storage infrastructure by verifying that your chosen storage targets support the necessary APIs and protocols for seamless integration.

UNDERSTANDING S3 WITH THE VAIL APPLICATION

The Vail application mimics the AWS S3 interface so that any client that uses S3 can interface with the Vail sphere without additional software. When integrating S3 with the Vail application, it is necessary to understand multiple technical aspects for consistent operation and optimal performance.

Configure AWS access keys (Access Key ID and Secret Access Key) for use with the Vail application, which uses the keys to authenticate API requests to S3 storage. Keys are configured in the Vail management console and provide programmatic access to S3 resources. Keys must be configured with sufficient permissions to access S3 buckets and perform required data storage operations. As a best practice, rotate access keys regularly and avoid embedding them in code. Store them securely using your security management tools.

Utilize IAM roles for secure and controlled access to data. IAM roles provide temporary security credentials, which reduce the risk of long-term credential exposure. The Vail application assumes an IAM role using AWS Security Token Service (STS). Use IAM policies that grant the minimum permissions necessary for Vail to function, following the principle of least privilege to minimize security risks. While less commonly used because of their complexity, ACLs can be configured to grant Vail access to individual objects in a bucket.

The Vail application supports multipart uploads for large files. For large file transfers, the Vail application breaks data into chunks to optimize upload and download performance. Configure chunk sizes appropriate for your network and storage performance requirements. If transferring large amounts of data over long distances, consider using AWS S3 Transfer Acceleration to speed up data transfers.

The Vail application uses AWS Signature Version 4 for signing API requests. Vail communicates with S3 over HTTPS so that data in transit is encrypted and secure. Additional security methods include using server-side encryption with AWS KMS (Key Management Service) for data at rest.

INTERFACING WITH TAPE LIBRARIES AND MEDIA

Tape storage is a highly reliable and cost-effective medium for long-term data archiving and backup. It offers substantial storage capacity at a lower cost per gigabyte compared to disk or solid-state storage, making it ideal for organizations managing large volumes of data. One of the key advantages of tape is its longevity, with a shelf life that can exceed 30 years, allowing for data preservation over extended periods.

Additionally, tape storage is known for its low energy consumption, as it does not require power when not in use, unlike spinning disks that consume power continuously. This can result in significant cost savings in terms of both energy and cooling requirements. Tapes also offer robust security features, including offline storage capabilities that provide an inherent protection against threats such as ransomware, which often target online systems.

The Vail application streamlines the data path to tape media using a BlackPearl S3 solution, which provides the interface between the Vail application and tape storage. The BlackPearl system stores data in a local cache before writing it to tape media. The cache ensures that data is managed efficiently and tape drives are utilized effectively.

When data is requested, a client issues an S3 Glacier command to move data from tape media (Glacier) to the BlackPearl cache. A second S3 command retrieves the data from the BlackPearl cache.

For S3 clients that do not support S3-Glacier commands, Vail offers a compatibility mode. This mode automatically issues an object restore command for objects in Glacier-tape class, which allows for seamless data retrieval without client-side modifications.

The information below provides additional information on how the Vail application uses tape media storage.

Tape Ingest

Vail supports the ingest and synchronization of existing BlackPearl buckets currently on tape media. This is useful if you have been using a BlackPearl system and want to integrate your existing data with the Vail application. The ingestion process involves adding a BlackPearl ingest agent, which performs a HEAD operation to index the objects into its database, and applies lifecycle rules as needed. If a lifecycle rule is not applied, objects remain on the BlackPearl system but are accessible as Glacier objects through the Vail application, requiring an Object Restore command for retrieval.

Vail allows for universal tape ingest within a BlackPearl system managed by the same Vail Sphere. This means tapes exported from one BlackPearl system can be imported into another without database or object migration. Vail handles the metadata ingest and makes objects available across the sphere. The metadata on imported tapes is read and ingested into the new BlackPearl system database.

Glacier Tape Packing

The Vail application attempts to generate 64 GB packs of data before transferring it to tape media, which allows for increased performance both for write and read operations. When a file is requested from a pack, the entire 64 GB pack is restored to the BlackPearl cache.

When deleting data files, a pack is not deleted unless every object in a pack is deleted. Because of this, if only some files in a pack are deleted in the Vail application, the deleted files will no longer be available but will still count against the available storage space on the tape cartridge. When the remaining files in the pack are deleted, the entire pack is deleted and the previously used storage space is made available.

SPECTRA LOGIC VAIL APPLICATION NAMING CONVENTIONS

Before configuring the Vail sphere, Spectra Logic recommends establishing a naming convention for your data storage infrastructure. A well-considered naming convention allows for easier setup and configuration, as well as a roadmap for naming Vail components added at a later date.

Use the information below to develop a naming convention for the Vail sphere and resources before you install and configure the Spectra Vail application.

The Spectra Vail application uses the same naming restrictions as Amazon Web Services. For more information on allowed naming conventions, see <u>AWS User Documentation</u>.

Vail Sphere Names

When using multiple Vail spheres, each sphere must have a unique name.

User Names

User names identify Vail sphere administrator users, as well as IAM users associated with the Vail sphere administrator's AWS account. Spectra Logic suggests using the same naming convention as your corporate email for user names.

For example, if associate Jane Smith uses the email address janes@yourcompany.com, use "janes" for the user name.

Group Names

Groups of users are typically configured when all users of the group share the same access policies. Spectra Logic suggests using self-explanatory names for groups.

For example, if your company's groups are assigned by department, use a naming convention that directly identifies each department such as Production, Engineering, or Accounting.

Location Names

Locations designate a physical location that contains Vail resources. Spectra Logic recommends naming each location after its physical location in the world.

For example, if Vail resources are located in Dallas, use that as the location name if there is only one Vail resource in that city. If there are multiple Vail resources consolidated in the same city, use suffixes to identify each group such as Dallas-HQ, Dallas-Research, or Dallas-Production.

Portable Location Names

Vail VM Node storage can be installed on a portable storage device such as a laptop or hardened disk array. Portable location names should be used for any device that only resides in a geographic location temporarily.

Storage Names

Storage names identify a storage target in the Vail sphere. Storage names are used for Vail VM node storage, VM pool storage, cloud storage, BlackPearl storage, and buckets or NAS shares configured on a BlackPearl system. Use the sections below to assist you in creating a storage name convention.

Vail VM Node Storage

The Vail VM node storage name is used as the top level name of the storage endpoint displayed in the Vail management console. Spectra Logic recommends using a name that includes both the location and type of storage.

For example, in the Dallas location, add the storage type as a suffix, such as Dallas-VM1 and Dallas-VM2.

VM Pool Storage

A Vail VM node uses one or more VM storage pools as data storage. Spectra Logic recommends using a name that includes the location, intended pool usage, and storage class.

For example, in the Dallas location, add suffixes for use and class such as Dallas_News_ Standard and Dallas_Backup_Glacier.

BlackPearl Storage

BlackPearl storage includes disk pools and volumes configured on the BlackPearl system. Spectra Logic recommends using names that include the location, BlackPearl name, physical medium, and storage class.

For example, in the Dallas location, add suffixes for the BlackPearl name, physical medium, and storage class such as Dallas.BlackPearl1-Object-Standard and Dallas.BlackPearl2-Tape-Glacier.

Cloud Storage

Cloud storage includes storage locations provided by Amazon and other third-party vendors. Spectra Logic recommends using names that include the vendor, location, storage class, and intended usage.

For example, AWS_USEast1_Standard_MarketingArchive.

Vail Bucket Names

Vail buckets are the highest level of object grouping in the Vail sphere. Vail buckets are used with lifecycle rules, and buckets can include permissions by user, group, or role.

Spectra Logic recommends using names that either include the intended usage or user group name combined with intended usage. If you use a naming convention by groups, the associated group can be easily given access to all buckets sharing the group name prefix.

For example, use usage names such as news-breaking and external-archive, or group and usage names such as eng-dev and eng-test.

Note: Spectra Logic recommends following Amazon AWS documentation naming conventions and restrictions to maintain consistency and avoid potential issues. See <u>AWS Bucket Naming Rules</u> for more information.

Cloud Bucket Names

Cloud bucket names identify high-level containers in cloud storage and are not visible to end users. However, cloud bucket names are displayed in the configuration wizard. Spectra Logic recommends using names that include the type of cloud storage, location, and storage class.

Note: Cloud bucket names are restricted to lowercase characters, and do not allow underscores.

For example, use names for AWS cloud storage such as vail-aws-uswest2-autotier and vail-aws-uswest2-S3glacier.

Note: Do not create AWS cloud storage buckets with the prefix "spectra-logic-vail-". Buckets with that prefix do not display in the storage creation wizard and cannot be configured for use.

BlackPearl Bucket Names

BlackPearl bucket names identify high-level containers configured on BlackPearl systems and are not visible to end users. However, BlackPearl bucket names are displayed in the configuration wizard. Spectra Logic recommends using names that include the storage policy used by the BlackPearl bucket.

For example, vail-singlecopytape and vail-dualcopytape.

Note: Spectra Logic recommends following Amazon AWS documentation naming conventions and restrictions to maintain consistency and avoid potential issues. See <u>AWS Bucket Naming Rules</u> for more information.

Lifecycle Names

Lifecycles are policies that control where data is cloned, moved, or expired over time. Spectra Logic recommends using names that directly indicate the specific lifecycle rule configuration.

For example, use names such as Copy_Everywhere_Keep4Days and Moveto_DallasNodeVM_After10Days.

Lifecycle Rule Names

Lifecycle rules are used within a Lifecycle to specify the parameters for clone, move, or expiration rules.

Additional AWS Account Role Names

By default, the Vail sphere is configured with a master Administrator AWS account. Additional AWS accounts can be configured in the Vail sphere. Spectra Logic recommends using a name that indicates the intended role for the additional AWS account.

For example, use a name such as VailSphereIAMreadandUserS3Control.

CHAPTER 2 - IMPORTANT INFORMATION

This chapter provides important information to know before using the Spectra Vail application.

Requirements	
Spectra Logic Products Requirements	
Supported Browsers	
Vail Management Console Overview - Local Control	
Main window	
Taskbar	
Toolbar	
Embedded Dashboard	
lcons	
Vail Management Console Overview - Cloud Control

REQUIREMENTS

The following sections describe the requirements for using the Spectra Vail application.

Spectra Logic Products Requirements

- The Spectra Vail application version 3.1.x or later requires either a BlackPearl Nearline Gateway or a Vail VM node.
 - The BlackPearl Nearline Gateway requires BlackPearl OS 5.7.4 or later with a valid Vail Sphere activation key installed.
 - A Vail VM node requires a host machine with at a minimum 8 CPU cores, 16 GB of system memory, and a 10 GigE network connection.
- An S3 compatible client is required to access data stored in the Vail sphere.

Note: S3 clients communicating with the Vail sphere must use AWS v4 authentication.

- The Spectra Vail application uses the following ports for communication with BlackPearl systems and Vail VM Nodes. These ports must be open in your network infrastructure for the Spectra Vail application to function correctly.
 - Inbound 80 and/or 443

Inbound access is needed for these ports to access the BlackPearl user interface, and for S3 clients to transfer data to the gateway, using either the open (80) or secure port (443).

• Outbound 443

Outbound access is needed for port 443 to allow data transfer to the Vail sphere, or other S3 endpoint nodes.

Supported Browsers

The Vail management console supports the Google[®] ChromeTM browser running on a Microsoft[®] Windows[®] or MacOS[®] system.

The browser versions listed below are supported.

Google Chrome:

- Windows: 88.0.4324.104 (Official Build) (x86_64), or later
- MacOS: 88.0.4324.96 (Official Build) (x86_64), or later

VAIL MANAGEMENT CONSOLE OVERVIEW - LOCAL CONTROL

The Vail management console provides browser-based configuration, management, and monitoring of the Vail sphere. The following sections describe the common features that appear in all screens in the management console when using Vail in a local control environment.

SPECTRA	BlackPearl S3 BPS2-S3-ISV4
♠ Dashboard	Endpoint

Figure 1 The Vail Sphere Dashboard screen.

Main window

The main window of the Vail management console displays the screen associated with each navigation link.

Taskbar

The taskbar (1) displays on the left side of all screens in the Vail management console. The following table provides a description of the selections in the taskbar.

Selection	Description
Dashboard	The Dashboard navigation link takes you to the Dashboard screen which provides an overview of the Vail sphere status, the total managed data in the sphere, number and type of endpoints, and location details about each location and associated storage. Locations also display on the world map.
	The information displayed in the Location Details pane displays varies based on which type(s) of storage are configured for each location. For BlackPearl storage, the embedded dashboard displays allowing you to easily use the most common functions of a BlackPearl S3 solution.
Storage	The Storage navigation link takes you to the Storage screen which displays configured endpoint and cloud storage, and provides access to the wizard for configuring new storage, as well as editing and deleting storage. See Create Storage on page 56.
Lifecycles	The Lifecycles navigation link takes you to the Lifecycles screen which displays configured lifecycles and provides access to the wizard to create new lifecycles, as well as editing and deleting lifecycles. See Create a Lifecycle on page 78
Buckets	The Buckets navigation link takes you to the Buckets screen which displays configured Vail buckets and provides access to the wizard to create new buckets, as well as editing and deleting buckets. See Create a Vail Bucket on page 86.
Capacity	The Capacity navigation link takes you to the Capacity screen which displays endpoint and cloud storage capacity information. See View Capacity Information on page 134.
Performance	The Performance navigation link takes you to the Performance screen which displays throughput and operation performance for both storage endpoints and the Vail sphere. See View Performance Metrics on page 137
Reports	The Reports navigation link takes you to the Reports screen which displays audit logs generated by the Vail sphere. Audit logs can be sorted by username or date. See View Reports on page 210.
Toolbar

The toolbar (**2**) displays in the upper-right of the Vail management console. The following table provides an overview of the selections in the toolbar.

lcon	Meaning	Description
٠	Messages	Displays the number of unread messages generated by the Vail sphere. The messages icon changes color depending on the highest severity message.
		The messages are categorized as:
		• Info - An expected event occurred such as the completion of a software update. (Blue icon color).
		• Warning - An event that may impact the operation of the Vail sphere occurred. Determine the cause of the problem and remedy the issue if necessary. (Yellow icon color).
		• Error - An event which impacts data storage operations occurred. This may happen if the Vail sphere cannot communicate with storage endpoint. (Red icon color).
	Settings	The settings menu allows you to:
•		Configure IAM accounts, users, and groups
		• Update the Spectra Vail application
		• Access Logs
		Configure Global Settings
		Configure Network Settings
		• Configure Entitlements (license keys)
0	Online Help	Opens a web browser to the Vail online help guide, a browser-based version of the Spectra Vail User Guide.
•	User	Displays the user currently logged-in and provides access to the logout function.

Embedded Dashboard

The BlackPearl embedded dashboard (**3**) displays in the bottom of the Vail management console. See BlackPearl Embedded Dashboard on page 225 for detailed information and instructions on using the features of the embedded dashboard.

lcons

The table below describes the icons that display on various screens in the Vail management console.

lcon	Meaning	Description
\square	View Details	Displays a detail screen for various aspects of the Vail sphere.
0	Unknown Status - Group	Displays when the status of the subcomponents of a group are unknown.
8	Good Status - Single	Indicates a good, working single component of the Vail sphere.
\oslash	Good Status - Group	Indicates a good, working group of components of the Vail sphere. This displays when all subcomponents of the group display good status.
	Warning Status	Indicates a problem with a component of the Vail sphere.
8	Error Status - Single	Indicates an error of a component of the Vail sphere.
8	Error Status - Group	Indicates an error with one or more subcomponents of the group.

VAIL MANAGEMENT CONSOLE OVERVIEW - CLOUD CONTROL

The Vail management console provides browser-based configuration, management, and monitoring of the Vail sphere. The following sections describe the common features that appear in all screens in the management console when using Vail in a cloud control environment.

CHAPTER 3 - CONFIGURE BLACKPEARL System

This chapter provides instructions for configuring a BlackPearl S3 solution for use with the Spectra Vail application.

Configure a BlackPearl S3 Solution	.44
Register a BlackPearl S3 with a Vail Sphere	.45
Register A Vail Sphere - Local Control	45
Register A Vail Sphere - Cloud Control	49

CONFIGURE A BLACKPEARL S3 SOLUTION

If you are using the Spectra Vail application in conjunction with a BlackPearl S3 solution, before you can access the Spectra Vail application, you must first install and configure the BlackPearl S3 solution.

Use the *BlackPearl Nearline Gateway User Guide* to configure your BlackPearl S3 solution.

Your BlackPearl S3 solution may have been installed and configured by Spectra Logic Professional Services.

Note: If you need assistance configuring your BlackPearl S3 solution, contact Spectra Logic. See Contacting Spectra Logic on page 10.

REGISTER A BLACKPEARL S3 WITH A VAIL SPHERE

Use one of the sections below to register a BlackPearl S3 solution with the Spectra Vail application:

- Register A Vail Sphere Local Control below
- Register A Vail Sphere Cloud Control on page 49

Register A Vail Sphere - Local Control

Here is how to register a BlackPearl S3 solution with a Vail sphere using local control:

- **Note:** For instructions on registering a Vail VM node to a Vail sphere, see Register a Vail VM Node with a Vail Sphere on page 262.
- **1.** Log in to the BlackPearl user interface.
- **2.** If necessary, configure the IP addressing for the BlackPearl S3 solution. The Spectra Vail application node running on a BlackPearl system uses the IP address configured for the BlackPearl data port.
 - **a.** Select **Configuration > Network**.
 - **b.** Under **Network Interfaces**, select the row of the data connection.
 - **c.** Select **Action > Edit**. Configure the network settings as needed and click **Save**.

IMPORTANT Spectra Logic recommends setting a static IP address.

- **3.** If desired, change the system name of the BlackPearl S3 solution. The Spectra Vail application uses this name for the Vail node name.
 - a. Select Status > Hardware.

Figure 3 The BlackPearl user interface Hardware screen.

- **b.** Click **Edit**, enter the desired **Name**, and click **Save**.
- **Note:** Spectra Logic recommends using the physical location of the BlackPearl system as the system name, for example Dallas.BlackPearl1-Object-Standard. The BlackPearl system name is limited to 15 characters before the first delimiter.
- 4. If necessary, add the Vail service key provided by Spectra Logic:
 - **a.** In the BlackPearl user interface, select **Support > Activation Keys**.
 - **b.** Select **Action > New**.
 - c. Enter the Activation Key and click Save.
- **5.** In the BlackPearl user interface, select **Configuration > Services**.
- **6.** Select the Vail service, then select **Action > Show Details**.

Figure 4 The Vail service details screen.

- **7.** If desired, select **Action > Edit** to change the pair of ports used by the Spectra Vail application for HTTP and HTTPS connections. The ports automatically selected depend on if you have buckets created on your BlackPearl system.
 - If buckets are configured on your BlackPearl system, the pair of ports selected is 80/443.
 - If no buckets are configured, the pair of ports selected is 8080/8443.
- **Note:** Whichever pair of ports is used by the Spectra Vail application, the other pair is used by the BlackPearl DS3 service. If you change the pair of ports for the Spectra Vail application, the DS3 service ports change to use the opposite pair of ports.
- **8.** Click the **Endpoint** link in the Vail service details screen. A new web browser launches. The default web certificate is invalid, use your browser to bypass the certificate screen.

Figure 7 The Activate screen.

- **11.**Enter the **Sphere Activation Key** and **Alternate Endpoint** provided by Spectra Logic.
- **12.**Click **Submit**. Wait approximately 15 seconds while the Vail management console refreshes.

Register A Vail Sphere - Cloud Control

Here is how to register a BlackPearl S3 solution with a Vail sphere using cloud control:

1. On the Vail dashboard screen, click **Register With Sphere**.

Figure 8 The Register with Sphere - Credentials screen.

- 2. Enter the Administrator Username and Administrator Password.
 - If this is the first BlackPearl system to register with a sphere, enter the credentials sent to the email address you provided to Spectra Logic when the sphere was created in AWS.

Note: You may need to set an email/MX rule to allow emails from AWS to the address entered when the sphere was created.

• Otherwise enter the credentials provided by your system administrator.

3. Click **Next**. If this is the first BlackPearl system to register with a sphere, you are prompted to set a new password. Otherwise, continue with Step 5.

Figure 11 The Register with Sphere - New Location screen.

- To search for a location...
 - **a.** In the **Address Search** field, enter a geographic location. You can enter a full or partial postal address, city, county, province, or country.
 - **b.** Select the correct match from the list.
 - **Note:** If no match is located, try changing the format of the address you entered. For example, use 9th Street in place of Ninth St.
 - **c.** If desired, manually edit the **Name**.

Spectra Logic recommends naming each location after its physical location in the world.

For example, if Vail resources are located in Dallas, use that as the location name if there is only one Vail resource in that city. If there are multiple Vail resources consolidated in the same city, use suffixes to identify each group such as Dallas-HQ, Dallas-Research, or Dallas-Production.

- **d.** Confirm the information is correct and click **Next**.
- To manually enter a location...
 - **a.** Enter the desired **Name**.

Spectra Logic recommends naming each location after its physical location in the world.

For example, if Vail resources are located in Dallas, use that as the location name if there is only one Vail resource in that city. If there are multiple Vail resources consolidated in the same city, use suffixes to identify each group such as Dallas-HQ, Dallas-Research, or Dallas-Production.

- **b.** Enter the **Latitude** and **Longitude** of the location.
- **Notes:** When entering a value for **Latitude**, use positive values for locations north of the equator, and negative values for locations south of the equator.
 - When entering a value for **Longitude**, use positive values for locations east of the prime meridian, and negative values for locations west of the prime meridian.
 - c. Click Next.

- To skip entering a location...
 - **a.** Enter the desired **Name**.

Spectra Logic recommends naming each location after its physical location in the world.

For example, if Vail resources are located in Dallas, use that as the location name if there is only one Vail resource in that city. If there are multiple Vail resources consolidated in the same city, use suffixes to identify each group such as Dallas-HQ, Dallas-Research, or Dallas-Production.

- **b.** Click **Next**.
- **Note:** If you do not enter an address or latitude and longitude, the location displays on the righthand pane of the Vail dashboard, but does not display on the world map.
- 3. Confirm the information is correct, and click **Register**.

Wait while the BlackPearl system registers with the Vail sphere. This may take several minutes, during which time the Vail management console may display communication errors.

Select an Existing Location

Here is how to select an existing location:

1. Using the drop-down menu, **Select a Location** where you want to associate the BlackPearl Vail node and click **Next**.

Figure 12 The Register with Sphere - Select Location screen.

2. Confirm the information is correct, and click **Register**.

Wait while the BlackPearl system registers with the Vail sphere. This may take several minutes, during which time the Vail management console may display communication errors.

CHAPTER 4 - CONFIGURE THE SPECTRA VAIL APPLICATION

This chapter describes the configuration steps for the Spectra Vail application.

Log In to the Vail Management Console	55
Create Storage	
Create BlackPearl Storage	57
Create BlackPearl Standard Bucket Storage	
Create BlackPearl Linked Bucket Storage	
Create BlackPearl Volume Pool Storage	
Create Cloud Storage	
Create Amazon S3 Cloud Storage	
Create Microsoft Azure Cloud Storage	
Create Google Cloud Platform Storage	
Create Other S3 Cloud Storage	
Create a Lifecycle	
Create a Vail Bucket	86
Configure an Object Storage Browser	94
Configure S3 Browser	
Configure Cyberduck Object Storage Browser	

LOG IN TO THE VAIL MANAGEMENT CONSOLE

Use the instructions below to log in to the Vail management console.

- **1.** Use one of the following methods:
- Open a compatible web browser and enter the Vail management console URL into the address bar.
- In the BlackPearl S3 solution management console, select **Configuration > Services**, then double-click the Vail service, and click the **Endpoint** URL displayed on the Vail Service screen.

Spectra	a Vail [®] Sphere	
	Username	
	Password	
	LOGIN	
	Forgot password?	

Figure 13 The Spectra Vail Sphere Login screen.

- **Note:** Your web browser may display an invalid certificate warning page. Resolve the warning, and continue to Step 2 below.
- **2.** Use one of the below methods:
 - For a **cloud control** system Enter the **Username** and **Password** you specified when you registered the first BlackPearl system with the Vail sphere.
 - For a **local control** system Enter the **Username** and **Password** of the BlackPearl system administrator.
- 3. Click LOGIN.

CREATE STORAGE

Storage is used by the Spectra Vail application as targets for S3 clients and lifecycles to store data. There are two basic types of storage: endpoint storage and cloud storage. Endpoint storage includes a BlackPearl S3 solution, or block VM storage such as a Vail VM node. Cloud storage is S3 object storage on AWS or other S3 cloud storage provider.

Use one of the sections below to create storage.

- Create BlackPearl Storage on the next page
- Create Cloud Storage on page 65
- Create a Vail VM Node on page 242

CREATE BLACKPEARL STORAGE

BlackPearl storage uses a bucket or Vail S3 share configured on a BlackPearl S3 solution. You can select the same BlackPearl S3 solution multiple times when creating BlackPearl storage, but each storage instance must use a unique bucket or Vail S3 share.

Note: Before you can create BlackPearl storage in the Vail management console, you must register the BlackPearl S3 solution with the Spectra Vail application. See Register a BlackPearl S3 with a Vail Sphere on page 45.

When creating BlackPearl storage, you can select to create storage using a standard bucket, or to create storage using a linked bucket.

Use one of the sections below:

- Create BlackPearl Standard Bucket Storage below
- Create BlackPearl Linked Bucket Storage on page 60
- Create BlackPearl Volume Pool Storage on page 62

Create BlackPearl Standard Bucket Storage

The instructions below assume a storage domain and data policy were previously configured on your BlackPearl S3 solution. For information on configuring a storage domain and data policy, see the *BlackPearl Nearline Gateway User Guide*.

A BlackPearl bucket does not need to be created before creating BlackPearl storage in the Vail application. A bucket is created automatically on the BlackPearl system during the process described below.

Here is how to create BlackPearl storage:

- **1.** Log in to the Vail management console.
- **2.** In the taskbar of the Vail management console, click **Storage**.

SP	PECTRA	Spectra Vail [®] Sphere		¢ 0	Admini	strator
A	Dashboard	🚍 Endpoint Storage				
	Storage					
Φ	Lifecycles	Helsinki				
	Buckets	Name	Туре	Access	Status

Select a type of storage.		
Select Storage Type		
BlackPearl Data Policy	v	

Figure 15 The Add BlackPearl Storage - Select Storage Type screen.

6. Use the **Select BlackPearl Data Policy** drop-down menu to select a previously configured data policy on the BlackPearl S3 solution. Only data policies configured to use Object Naming display in the drop-down menu.

Storage Type	2	Parameters	3 Confirm
onfigure your BlackPearl storage be	OW.		
Select BlackPearl Data Policy	• ⑦	Storage Name	
Select Storage Class	~		
Third-party Recovery 🤊		Restore To New Clone	e ⑦
Caution Threshold		Warning Threshold	
70	%	80	% (?)

Figure 16 The Add BlackPearl Storage - Parameters screen.

7. Enter a **Storage Name** for the BlackPearl storage.

Spectra Logic recommends using names that include the location, BlackPearl name, physical medium, and storage class.

For example, in the Dallas location add suffixes for the BlackPearl name, physical medium and storage class such as Dallas-BlackPearl1-Object-SA and Dallas-BlackPearl2-Tape-Glacier.

- **8.** Use the **Select Storage Class** drop-down menu to select the storage class for the BlackPearl storage. The selections that display depend on the type of storage medium targeted by the BlackPearl data policy.
- **9.** If desired, select to enable **Third-party Recovery**. This option creates a clone for delete markers, 0-length objects, and tiny objects, even though those clones are unnecessary. It also causes storage of full object metadata, enabling you to generate full objects from the content on the storage endpoint.

Note: This option uses additional storage space and negatively affects performance.

10.If desired, select to enable **Restore to New Clone**. This option creates an additional data clone of objects on the storage endpoint to a different storage endpoint.

- **11.**If desired, edit the **Caution Threshold** and **Warning Threshold**. These settings control when the Spectra Vail application sends a notification that the selected bucket capacity reaches the configured thresholds.
- 12.Click Next.
- **13.**Review the configuration and click **Submit** to create the BlackPearl storage. The BlackPearl bucket to be used with this storage is automatically created on the BlackPearl system.

Create BlackPearl Linked Bucket Storage

BlackPearl linked bucket storage allows you to link a BlackPearl bucket with a Vail bucket. When linking these buckets, changes made in the BlackPearl bucket are not automatically detected by the Vail application. The Vail bucket must be manually scanned to determine object changes in the BlackPearl bucket. See Scan a Vail Bucket on page 1 for instructions on scanning a Vail bucket.

Here is how to create linked bucket BlackPearl storage:

- **1.** Log in to the Vail management console.
- **2.** If necessary, create a bucket as described in Create a Vail Bucket on page 86, then return to this section.
- **3.** In the taskbar of the Vail management console, click **Storage**.
- **4.** Select the row of the BlackPearl S3 solution where you want to create linked bucket storage.
- 5. Under the **Endpoint Storage** banner, click **Add**.

Figure 19 The Add BlackPearl Storage - Parameters screen.

8. Enter a **Storage Name** for the BlackPearl storage.

Spectra Logic recommends using names that include the location, BlackPearl name, physical medium, and storage class.

For example, in the Dallas location add suffixes for the BlackPearl name, physical medium and storage class such as Dallas-BlackPearl1-Object-SA and Dallas-BlackPearl2-Tape-Glacier

- **9.** Use the **Select Storage Class** drop-down menu to select the storage class for the BlackPearl storage. The selections that display depend on the type of storage medium targeted by the BlackPearl data policy used by the BlackPearl bucket selected in Step 7.
- **10.**Use the **Select Bucket to Link** drop-down menu to select a previously configured Vail bucket.
- **11.**If desired, select to enable **Restore to New Clone**. This option creates an additional data clone of objects on the storage endpoint to a different storage endpoint.

12.Click Next.

13.Review the configuration and click **Submit** to create the BlackPearl linked bucket storage.

Create BlackPearl Volume Pool Storage

BlackPearl volume pool storage is NAS storage provided by a BlackPearl system.

The instructions below assume a storage pool was previously configured on your BlackPearl S3 solution. For information on configuring a storage pool, see the *BlackPearl Nearline Gateway User Guide*.

Here is how to create BlackPearl volume pool storage:

- 1. In the taskbar of the Vail management console, click **Storage**.
- **2.** Select the row of the BlackPearl S3 solution where you want to create storage.
- **3.** Under the **Endpoint Storage** banner, click **Add**.

SP	ECTRA	Spectra Vail [®] Sphere		¢ 0	Admi 🔺	inistrator

		Units	
			• 0
Quota		MIB	

Figure 22 The Add BlackPearl Volume Pool Storage - Parameters screen.

6. Enter a **Storage Name**.

- **7.** Using the **Select Storage Class** drop-down menu, select the storage class you want to use for this volume pool storage endpoint.
- **8.** If desired, select to enable **Third-Party Recovery**. This option creates a clone for delete markers, 0-length objects, and tiny objects, even though those clones are unnecessary. It also enables storage of full object metadata, which allows you to generate full objects from the content on the storage endpoint.

Note: This option uses additional storage space and negatively affects performance.

- **9.** If desired, edit the **Caution Threshold** and **Warning Threshold**. These settings control when the Spectra Vail application sends a notification that the selected bucket capacity reaches the configured thresholds.
- **10.**If desired, edit the **Optional Data** percentage. This setting controls the amount of space used by optional data clones, which use available storage space to speed up data access. When the system reaches the percentage value specified, optional clones are deleted to maintain the percentage of used storage space under the specified value.
- **Note:** If this field is left blank, no optional clones are stored and object access times are not recorded.
- **11.** If desired, enter a value for a **Quota**, and use the **Units** drop-down menu to select a unit size for the quota value. This setting controls the maximum amount of storage space on the storage pool that is used for the BlackPearl volume pool storage endpoint. When this percentage is reached, no additional data is added to the storage endpoint. If you do not want to use a quota limit, leave the fields blank.
- **Notes:** Spectra Logic recommends setting a quota of 90% of volume storage space, or lower if desired.
 - This setting can be modified after the BlackPearl volume pool storage is created.

12.Click Next.

13.Confirm all settings are correct and click **Submit**.

CREATE CLOUD STORAGE

Use one of the sections below to configure cloud storage:

- Create Amazon S3 Cloud Storage below
- Create Microsoft Azure Cloud Storage on page 69
- Create Google Cloud Platform Storage on page 72
- Create Other S3 Cloud Storage on page 75

Create Amazon S3 Cloud Storage

In Vail, Amazon S3 cloud storage uses a previously configured AWS endpoint target for object storage.

Here is how to create Amazon S3 cloud storage:

- 1. In the taskbar of the Vail management console, click **Storage**.
- 2. Under the Cloud Storage banner, click Add.

ा Cloud Storage ^⑦					
+ ADD P EDIT ELETE					
Name	Provider	Туре	Access	Status	
No items to display.					

Figure 23 The Cloud Storage pane.

3. Use the **Select Storage Type** drop-down menu to select **Amazon S3 Cloud Bucket**, and click **Next**.

Aud Cloud Storage			• ~
1 Storage Type 2 Author	orization —	3 Parameters	Confirm
Select a type of storage.			
Select Storage Type			
•	_		

4. Select the desired authorization used to access cloud storage.

Cloud Provider — 2 Authorization	9 Parameters —	4 Confirm
nter your authorization data below.		
Region	AWS Access Key ID	
AWS Secret Access Key	AWS IAM Role ARN	?
AWS IAM Role External ID		
Optional. Specifies who can assume the role.		

Figure 25 The Add Cloud Storage - AWS Authorization screen.

- To use the credentials of the AWS account associated with the Vail sphere administrator, leave the fields blank.
- To connect to cloud storage associated with a different AWS account, enter the **Region**, **AWS Access Key ID**, **AWS Secret Access Key**, and the **AWS IAM Role ARN** of the account. Optionally, enter the **AWS IAM Role External ID**.
 - 5. Click Next.

- **6.** Use the **Select Cloud Bucket** drop-down menu to select a cloud bucket associated with the AWS or IAM user configured for cloud storage.
- **Note:** AWS Buckets must be configured to use versioning before they can be used as cloud storage, even if they are assigned to a Vail bucket that has versioning disabled. Although the AWS bucket is capable of storing multiple versions of an object, if the Vail bucket does not have versioning enabled, only the latest version is preserved in the AWS bucket.

Select Cloud Bucket	
Link to Bucket Do Not Link ② Select Storage Class ③ Select Storage Class ④ Select Storage Class ④ Select Storage Class ● Sel	• ?
Pause Notifications Third party Recovery (2)	

Figure 26 The Add Cloud Storage - Parameters screen.

7. The **Storage Name** field is automatically populated with the name of the bucket selected in Step 6. If desired, you can change the **Storage Name**. Spectra Logic recommends using names that include type of cloud storage, location, and storage class.

For example, use names for Amazon cloud storage such as AWS_uswest2_autotier and AWS_uswest2_S3glacier.

8. Use the **Link to Bucket** drop-down menu to select the Vail bucket which you want to link with the AWS S3 storage endpoint.

Note: If you want to link to a Vail bucket, the bucket must be created prior to creating the AWS S3 storage.

If a Vail bucket is linked to an AWS cloud bucket, when an object is added to an AWS cloud bucket, the Spectra Vail application creates a version of the object with a clone that references the object in the AWS bucket. Because the objects are linked, if the object is deleted in the Spectra Vail application, the object on the AWS cloud bucket is deleted, even if no lifecycle is defined. If there are multiple versions of the object in the Spectra Vail application, when the object is deleted, only the object on the AWS cloud bucket that matches the version deleted in the Spectra Vail application is deleted from the AWS bucket.

- **9.** Use the **Select Storage Class** drop-down menu to select a storage class for the AWS S3 storage.
- **10.**If you selected to link to a Vail bucket, select or clear **Pause Notifications** as desired. When notifications are paused, changes are only recognized when the bucket scan is manually triggered, either through the Vail management console or by API call.

Note: If you do not link to a Vail bucket, this option is greyed-out and non-functional.

11.If desired, select to enable **Third-Party Recovery**. This option creates a clone for delete markers, 0-length objects, and tiny objects, even though those clones are unnecessary. It also enables storage of full object metadata, which allows you to generate full objects from the content on the storage endpoint.

Note: This option uses additional storage space and negatively affects performance.

12.Click **Next**.

13.Verify the information for the cloud storage is correct, and click **Submit**.

- Notes: There is a seven minute delay before the contents of the AWS bucket appear in the Vail bucket. If the Vail bucket is assigned to a lifecycle that is configured to run immediately, any data present in the AWS bucket is processed by the lifecycle after seven minutes.
 - By default the cloud storage target is created with the Storage Class set to Standard. If desired, you can edit the cloud storage target to change the Storage Class. See Edit Google Cloud Platform Storage on page 181.

Create Microsoft Azure Cloud Storage

In the Vail application, Microsoft Azure cloud storage uses a previously configured Azure container for storage.

Here is how to create Microsoft Azure cloud storage:

- 1. In the taskbar of the Vail management console, click **Storage**.
- 2. Under the Cloud Storage banner, click Add.

+ ADD / EDIT					
Name	Provider	Туре	Access	Status	

Figure 27 The Cloud Storage pane.

3. Use the Select Storage Type drop-down menu to select Azure Container, and click Next.

- **6.** Using the **Select Container** drop-down menu, select a previously created container on the Azure storage target.
- **7.** Enter a **Storage Name**, then click **Next**.
- **8.** Use the **Select Storage Class** drop-down menu to select a storage class for the Azure storage endpoint.

9. If desired, select to enable **Third-Party Recovery**. This option creates a clone for delete markers, 0-length objects, and tiny objects, even though those clones are unnecessary. It also enables storage of full object metadata, which allows you to generate full objects from the content on the storage endpoint.

Note: This option uses additional storage space and negatively affects performance.

10. If you selected Glacier or Deep Archive as the storage class, if desired, select to enable **Restore In Place**. The restore in-place option uses internal resources on archival storage to create a clone in the same storage. If this setting is not enabled, new clones are created on different storage. Selecting this option may use additional cache space or incur additional cloud storage fees.

11.Click Next.

12.Verify the information for the cloud storage is correct, and click **Submit**.

Create Google Cloud Platform Storage

In Vail, Google Cloud Platform storage uses a previously configured Google storage endpoint target for storage.

Here is how to create Google Cloud Platform storage:

- 1. In the taskbar of the Vail management console, click **Storage**.
- 2. Under the Cloud Storage banner, click Add.

+ ADD / EDIT					
Name	Provider	Туре	Access	Status	

Figure 31 The Cloud Storage pane.

3. Use the **Select Storage Type** drop-down menu to select **Google Cloud Bucket**, and click **Next**.

- **6.** Using the **Select Google Cloud Bucket** drop-down, select a previously created bucket in the Google Cloud Storage target.
- **7.** Enter a **Storage Name**.
- **8.** Use the **Select Storage Class** drop-down menu to select a storage class for the Azure storage endpoint.

9. If desired, select to enable **Third-Party Recovery**. This option creates a clone for delete markers, 0-length objects, and tiny objects, even though those clones are unnecessary. It also enables storage of full object metadata, which allows you to generate full objects from the content on the storage endpoint.

Note: This option uses additional storage space and negatively affects performance.

10.Click **Next**.

11.Verify the information for the cloud storage is correct, and click **Submit**.

Create Other S3 Cloud Storage

Cloud storage that is not an AWS, Azure, or Google Cloud endpoint is configured as other third-party S3 cloud storage.

Note: The bucket on the cloud storage target must be configured to use versioning.

Here is how to create other third-party S3 cloud storage:

- **1.** In the taskbar of the Vail management console, click **Storage**.
- 2. Under the Cloud Storage banner, click Add.
- **3.** Use the **Select Storage Type** drop-down menu to select **Other S3 Cloud Bucket** and click **Next**.

1 Storage Type ———	2 Authorization ——	3 Parameters	Confirm
Select a type of storage.			
Select Storage Type			
	•		

Figure 35 The Add Cloud Storage - Storage Type screen.

4. Enter the URL address for the **Data Path Endpoint**.

Link to Bucket Do Not Link	• ⑦	Select Storage Class		• ?
Pause Notifications				
☐ Third-party Recovery ⑦		Restore In-place 🧐		
Addressing Style ?				
Path O Virtual Hosted				

Figure 37 The Add Cloud Storage - 3rd Party Parameters screen displaying all possible settings. Your screen may appear different depending on the type of bucket selected.

10. The **Storage Name** is automatically populated with the name of the bucket selected in Step 9. If desired, you can change the **Storage Name**.

- **11.**If desired, use the **Link to Bucket** drop-down menu to select an existing Vail bucket that you want to link with the Other S3 storage endpoint. When linking these buckets, changes made in the Other S3 bucket are not automatically detected by the Vail application. The Vail bucket must be manually scanned to determine object changes in the S3 Other bucket. See Scan a Vail Bucket on page 1 for instructions on scanning a Vail bucket.
- **12.**If you select to link to a Vail bucket, **Pause Notifications** is automatically selected and cannot be changed. Otherwise, the setting is cleared and cannot be changed.
- **13.**Use the **Select Storage Class** drop-down menu to configure the storage class you want to use for this endpoint. The selected storage class is used when creating clones on the cloud bucket.
- **Note:** The financial costs associated with each storage type are controlled by the cloud provider.
- **14.**If desired, select to enable **Third-Party Recovery**. This option creates a clone for delete markers, 0-length objects, and tiny objects, even though those clones are unnecessary. It also enables storage of full object metadata, which allows you to generate full objects from the content on the storage endpoint.

Note: This option uses additional storage space and negatively affects performance.

- **15.**If you selected Glacier or Deep Archive as the storage class, if desired, select to enable **Restore In Place**. The restore in-place option uses internal resources on archival storage to create a clone in the same storage. If this setting is not enabled, new clones are created on different storage. Selecting this option may use additional cache space or incur additional cloud storage fees.
- **16.**Select the desired **Addressing Style**. This setting controls the URL format used when communicating with the cloud storage provider.

Selection	Description
Path Style	Path style formatting uses the bucket name as part of the URL path. Example : <i>http://endpoint/bucket-name/object-key</i>
Virtual-Hosted	Virtual-hosted style addressing uses the bucket as the prefix to the endpoint name Example : <i>http://bucket-name.endpoint/object-key</i>

17.Click Next.

18. Verify the information for the cloud storage is correct, and click **Submit**.

CREATE A LIFECYCLE

Lifecycles control where data is located, at what times, and for how long. When data is added to a Vail bucket, lifecycle rules determine where objects are initially placed, how data placement changes over time, and when to delete objects. Placement rules change data placement without altering the bucket contents. Deletion rules delete objects and should be used with caution.

Lifecycle rules are processed once per day. When this occurs, the Vail application generates a list of objects to be moved or expired and then processes the objects as a background process. The default processing time is midnight UTC, but processing time of day can be changed in the Global Settings. See Change Lifecycle Rule Nightly Processing Time on page 156.

IMPORTANT

The Vail application does not support aggregating storage pools that use the same storage class. You must configure separate Lifecycles that each target different storage to use multiple storage pools of the same storage class.

Here is how to create a lifecycle:

- 1. In the Vail management console taskbar, click Lifecycles.
- 2. Under the Lifecycles banner, click Create.

SP	ECTRA	Vail Sphere			۵	Administrator
A	Dashboard	\diamondsuit Lifecycles $^{\textcircled{0}}$				
	Storage		T DELETE			
φ	Lifecycles	Lifecycle Name	Modified	Number of Rules		
	Buckets	vail-demo-uk-rule	Mar 29, 2019 4:03:24 PM	1		
¢	Capacity	vail-demo-us-rule	Mar 29, 2019 4:03:24 PM	1		Z

Figure 38 The Lifecycles screen.

3. Enter the desired **Name**.

Spectra Logic recommends using names that directly indicate the specific lifecycle rule configuration.

For example, use names such as Clone_Everywhere_Keep4Days and Moveto_ DallasNodeVM_After10Days.

1 Parameters		2 Rules
Configure your new life	ecycle.	
Name	Multipart Upload Ex	xpiration
1 Day	7	days 🧑
Force Initial Cop Ignore Requeste	y ⑦ d Storage Class ⑦	
Force Initial Cop Ignore Requeste Description	y ⑦ d Storage Class ⑦	

Figure 39 The Create Lifecycle - Parameters screen.

4. Enter a value for **Multipart Upload Expiration** in days. This setting controls how long the Spectra Vail application waits before aborting multipart uploads. When the multipart upload aborts, all parts of the upload are deleted. This prevents retaining multiple incomplete uploads.

Note: To prevent multipart uploads from expiring, enter zero.

- **5.** Select or clear **Delete Marker Expiration**. A delete marker keeps track of deletions of versioned objects so that S3 can determine if the object is missing. If enabled, the Spectra Vail application removes delete markers when they are the last remaining version of an object.
- **6.** Select or clear **Force Initial Copy**. When enabled, the Vail application initially places data as STANDARD storage. Additional clones are created immediately as GLACIER storage. This may provide performance advantages as copying clones to GLACIER results in a clone that is ordered sequentially and more optimally packed.
- **7.** Select or clear **Ignore Requested Storage Class**. When enabled, the Vail application does not consider the storage class requested in a PUT or upload operation and instead uses the storage class of the selected storage endpoint.

- **8.** If desired, use the **Description** field to enter any additional information.
- 9. Click Next.
- **10.**Add one or more placement or deletion rules. Placement rules add and remove clones from storage destinations, but do not change bucket contents. Deletion rules delete objects and should be used with caution.

Note: Each lifecycle is limited to five total rules.

- Add a Placement Rule below
- Add a Deletion Rule on page 83

Add a Placement Rule

Placement rules add object clones to the selected destination storage and optionally remove clones from storage destinations not specified in the placement rule. Placement rules do not alter bucket contents.

1. Click New Placement Rule.

-		
Parameters	(2 Rules
efine your rules for test2 . ⑦ ote: Rules will be sorted based on schedule and version filters umber of rules is 5.	after submission. N	laximum
Placement Rule		
Name		
Select Destination Storage		• ?
Sciect Destination Storage		
Delete clones not on selected destination storage	Destination All	n Count 👻
Delete clones not on selected destination storage ADD SCHEDULE FILTER	All	n Count T
Delete clones not on selected destination storage ADD SCHEDULE FILTER	Destination All	n Count
Delete clones not on selected destination storage ADD SCHEDULE FILTER NEW PLACEMENT RULE NEW DELETION RULE	Destination All	n Count

- 2. Enter the desired Name.
- **3.** Use the **Select Destination Storage** drop-down menu to select up to five previously configured storage destinations
- **Note:** To remove a destination from the list, select the **Select Destination Storage** drop-down menu, and click on the purple highlighted row of the destination you want to remove.
- **4.** If desired, select to **Delete clones not on selected destination storage**. This option removes clones from any destination storage not selected in Step 3.

Note: This option only removes object clones. It does not change bucket contents.

- **5.** Use the **Destination Count** drop-down menu to select the number of storage destinations you want to maintain a copy of the data when the rule executes, up to a maximum of five. If you have less than five storage endpoints, you are only able to select a number equal to or less than the number of storage endpoints. If you select **All**, every storage endpoint maintains a copy of object data
- **Note:** If you select two destinations, but enter five storage destinations, then two copies of the object are maintained on any of the five specified destinations. The order in which you select destinations is the order the Vail sphere uses to determine where to store a copy of the data. If a storage destination is not available or busy when the rule executes, the Vail sphere selects the next destination.
- Using the Filter drop-down menu (1), select the desired filter, then click the Add Filter Name button (2). The screen expands to show the details of the selected filter.

Figure 41 The Select Filter drop-down menu (1) and Add Filter Name button (2).

If you selected	Do the following
Schedule Filter	• Specify a Older Than number of days . When an object is older than this value, the Vail application applies the placement rule on the objects at the next daily processing time.
	• Entering a value of zero applies the placement rule on the next daily processing time, which is between zero and 24 hours later.
	• To apply the placement rule immediately after the lifecycle is created, do not configure a schedule filter. Click the trashcan icon to remove the schedule filter.
	See Edit Global Settings on page 156 to view the currently configured daily processing time.
	Note: You can only configure one Schedule filter.
Latest Version Filter	No actions are required. The Vail application applies the placement rule to the latest version of objects.
	Note: If you select the Latest Version filter, you cannot select the Previous Version filter.
Previous Version Filter	No actions are required. The Vail application applies the placement rule to the previous version of objects.
	Note: If you select the Previous Version filter, you cannot select the Latest Version filter.
Include Name Filter	Enter a regular expression. The placement rule applies to any object with a name that matches the provided expression.
	Note: If multiple Include Name filters are applied to the placement rule, the placement rule applies if <u>any</u> of the filters match the object name.
Exclude Name Filter	Enter a regular expression. The placement rule applies to any object with a name that matches the provided expression.
	Note: If multiple Exclude Name filters are applied to the placement rule, the placement rule applies if <u>any</u> of the filters match the object name.
Include Object Tag Filter	• Enter a Key and Value . The placement rule applies to any object with a matching object tag. The fields are case-sensitive. Object tag filtering is case-sensitive and object tags must be an exact match.
	• If no Value setting is entered, the placement rule applies to all objects with an object tag that matches the specified Key .
	Note: If multiple Include Object Tag filters are applied to the placement rule, the placement rule applies if <u>any</u> of the filters match the object name.

7. Use the table below to complete configuring the filter.

If you selected	Do the following
Exclude Object Tag Filter	• Enter a Key and Value . The placement rule applies to any object with a matching object tag. The fields are case-sensitive. Object tag filtering is case-sensitive and object tags must be an exact match.
	• If no Value setting is entered, the placement rule applies to all objects with an object tag that matches the specified Key .
	Note: If multiple Exclude Object Tag filters are applied to the placement rule, the placement rule applies if <u>any</u> of the filters match the object name.

- 8. If desired, add additional Placement or Deletion rules.
- 9. Click Submit.

Add a Deletion Rule

Use deletion rules to delete objects at a specified interval. If a storage location uses versioning, deletion rules can be configured to delete the latest or previous version of an object, or all versions.

Note: Deletion rules always removes delete markers if the rule criteria are met.

1. Click New Deletion Rule.

- 2. Enter the desired Name.
- Using the Filter drop-down menu (1), select the desired filter, then click the Add Filter Name button (2). The screen expands to show the details of the selected filter.

Figure 43 The Select Filter drop-down menu (1) and Add Filter Name button (2).

4. Use the table below to complete configuring the filter.

If you selected	Do the following
Schedule Filter	• Specify a Older Than number of days . When an object is older than this value, the Vail application applies the deletion rule on the objects at the next daily processing time.
	• Entering a value of zero applies the deletion rule on the next daily processing time, which is between zero and 24 hours later.
	• To apply the deletion rule immediately after the lifecycle is created, do not configure a schedule filter. Click the trashcan icon to remove the schedule filter.
	See Edit Global Settings on page 156 to view the currently configured daily processing time.
	Note: You can only configure one Schedule filter.
Latest Version Filter	No actions are required. The Vail application applies the deletion rule to the latest version of objects.
	Note: If you select the Latest Version filter, you cannot select the Previous Version filter.
Previous Version Filter	Enter a number of non-concurrent versions of an object that should be kept and not expired. When this limit is reached, any excess non-concurrent versions are allowed to expire based on the configured schedule filter.
	Note: If you select the Previous Version filter, you cannot select the Latest Version filter.
Include Name Filter	Enter a regular expression. The deletion rule applies to any object with a name that matches the provided expression.

If you selected	Do the following
	Note: If multiple Include Name filters are applied to the deletion rule, the deletion rule applies if <u>any</u> of the filters match the object name.
Exclude Name Filter	Enter a regular expression. The deletion rule applies to any object with a name that matches the provided expression. Note: If multiple Exclude Name filters are applied to the deletion rule, the deletion rule applies if <u>any</u> of the filters match the object name.
Include Object Tag Filter	 Enter a Key and Value. The deletion rule applies to any object with an matching object tag. The fields are case-sensitive. Object tag filtering is case-sensitive and object tags must be an exact match. If no Value acting is entered, the deletion rule applies to all object with
	an object tag that matches the specified Key .
	Note: If multiple Include Object Tag filters are applied to the deletion rule, the deletion rule applies if <u>any</u> of the filters match the object name.
Exclude Object Tag Filter	• Enter a Key and Value . The deletion rule applies to any object with an matching object tag. The fields are case-sensitive. Object tag filtering is case-sensitive and object tags must be an exact match.
	• If no Value setting is entered, the deletion rule applies to all objects with an object tag that matches the specified Key .
	Note: If multiple Exclude Object Tag filters are applied to the deletion rule, the deletion rule applies if <u>any</u> of the filters match the object name.

- **5.** If desired, add additional Placement or Deletion rules.
- 6. Click Submit.

CREATE A VAIL BUCKET

A Vail bucket is a logical target that is shared across the entire Vail sphere. Objects are placed and retrieved from a Vail bucket using an S3 compatible client. Data is then migrated to storage locations using the lifecycle associated with the bucket.

Note: A Vail sphere is limited to 1000 buckets.

Vail buckets can also be linked to an existing bucket on a BlackPearl system or AWS S3 storage endpoint. When buckets are linked, any changes to one bucket are propagated to the other bucket automatically. Only one linked bucket is allowed per storage location. You cannot link a bucket to non-AWS cloud storage endpoints.

Note: When a Vail bucket is linked to an AWS cloud bucket, the Spectra Vail application synchronizes the buckets such that changes made on one bucket are propagated to the other bucket. In normal S3 operations, a very small object, such as a 0-length delete marker, is not cloned. However in a linked bucket configuration, small objects created on the linked cloud storage are represented by a clone in the Spectra Vail application because of the bucket synchronization. These clones display in the Vail management console and can be deleted. Deleting the clone of an object results in the object appearing that it was originally created on the Vail storage, not the linked cloud bucket.

If a Vail bucket is linked to an AWS cloud bucket, when an object is added to an AWS cloud bucket, the Spectra Vail application creates a version of the object with a clone that references the object in the AWS bucket. Because the objects are linked, if the object is deleted in the Spectra Vail application, the object on the AWS cloud bucket is deleted, even if no lifecycle is defined. If there are multiple versions of the object in the Spectra Vail application, when the object is deleted, only the object on the AWS cloud bucket that matches the version deleted in the Spectra Vail application is deleted from the AWS bucket.

Here is how to create a Vail bucket:

IMPORTANT

- 1. In the Vail management console taskbar, click **Buckets**.
- 2. Under the **Buckets** banner, click **Create**.

SF	ECTRA	Spectra Vail [®] Sphere				
A	Dashboard	Buckets				
	Storage					
φ	Lifecycles	Name	Linked Storage	Date Created		
	Buckets	No items to display.				

Figure 44 The Buckets screen.

3. Enter the desired **Bucket Name**. Spectra Logic recommends using names that either include the intended usage or user a group name combined with intended usage. If you use a naming convention by groups, the associated group can be easily given access to all buckets sharing the group name prefix.

For example, use usage names such as news-breaking and external-archive, or group and usage name such as eng-dev and eng-test.

- **Note:** Vail bucket names must be between three and 63 characters, using only lowercase letters and numbers. The period (.) and dash (-) characters are valid in the middle of the bucket name, but are not valid as the first or last character of a bucket name.
- **Note:** Spectra Logic recommends following Amazon AWS documentation naming conventions and restrictions to maintain consistency and avoid potential issues. See <u>AWS Bucket Naming Rules</u> for more information.

Parameters	2 Policy	3 Lifecvcle	Confirm
Configure your new bucket.			
Bucket Name			
Enable Versioning Enable	Object Locking 🔊		
🗌 Enable Encryption 🔽 Enable	Compression [] Hide Glacier Operations	s ??
Bucket Owner			
vail.development	.		
Object Ownership			
ACLs Disabled (recommended)	• ⑦		

Figure 45 The Create Bucket - Parameters screen.

4. If desired, select **Enable Versioning** to allow the bucket to store multiple versions of an object.

5. If desired, select **Enable Object Locking**. This allows you to protect the state of an object when the lock is applied, while also allowing other versions non-locked versions to be modified, and allows new versions of an object to be added to the bucket.

There are two types of locks that can be used. A retention lock expires on a specific date and time. A legal lock must be manually removed.

- **Notes:** Objects can be locked both when they are added to the bucket, and while they reside in the bucket using the Vail API.
 - Locked objects display a locked in the Vail management console.
 - This option is greyed-out unless you selected to enable versioning in Step 4.
- 6. If desired, select **Enable Encryption** to encrypt data copied to the Vail bucket.

IMPORTANT Files archived to an encrypted Vail bucket can only be decrypted by the Spectra Vail application.

- **Note:** You must use the key provided by Spectra Logic when transferring data to a Vail bucket configured to use encryption, or data transfers to the bucket fail.
- **7.** If desired, select **Enable Compression** to allow the Spectra Vail application to compact objects placed in the Vail bucket.
- **Note:** Compression is not recommended if your workflow only uses files that are already compressed, such as ZIP files.
- **8.** If desired, select **Hide Glacier Operations**. This option allows S3 clients that do not fully support restoring from AWS S3 Glacier tier storage by automatically requesting the object from Glacier storage when the client requests the object.
- **Note:** Enabling this option changes the response from the Spectra Vail application to the S3 client when an object is not immediately available. Instead of a 403 invalid object state error, a 503 service unavailable error is returned.

IMPORTANT This option is not compatible with S3 clients that fully support Glacier storage restores and may interfere with normal operation.

9. Use the **Bucket Owner** drop-down menu to select a user to own the bucket. The bucket owner sets permissions for the bucket.

10. Use the **Object Ownership** drop-down menu to select the type of ownership used for new objects, and how Access Control Lists (ACLs) are used.

Option	Description
ACLs Disabled	New objects written to this bucket are always owned by the bucket owner configured in Step 9.
	 Access to this bucket and its objects is specified using only policies. Note: This is the recommended setting.
Bucket Owner Preferred If new objects written to this bucket specify the <i>bucket-owner-full-control</i> ACL, the objects are owned by the bucket owner. Otherwise they are of the object writer.	
	• Access to this bucket and its objects can be specified using ACLs or policies.
Object Writer	New objects written to the bucket are always owned by the object writer.
	 Access to this bucket and its objects can be specified using either ACLs or policies.

Note: If Object Permissions is configured to use Object Writer, if an object is added to the bucket by a different account, that object is owned by the other account, but permissions for bucket operations are still controlled on the bucket owner

11.Click **Next**.

- If you selected **Enable Object Locking** in Step 5 on page 88, continue with Step 12 below
- Otherwise, skip to Step 16 on page 91.

12.If desired, select **Use Default Retention** to configure a retention policy for objects to use if they are not uploaded to the bucket with a specified retention lock. To continue without specifying a default retention policy, click **Next** and skip to Step 16 on page 91.

Parameters	2 Retention —	3 Policy	— 4 Lifecycle —	5 Confir
Use Default Retention	" ⑦			
Retention Mode				
Compliance	*			
Unit of Time				
Days	*			
Number of Davs				

Figure 46 The Create Bucket - Retention screen.

- **13.**Use the **Retention Mode** drop-down menu to select the type of default retention lock. Retention locks have two modes that specify how the lock can be modified. Both Governance and Compliance mode locks can have the retention period extended.
 - Retention locks in **Governance** mode can be reduced or removed if the user making the request has the correct permissions.
 - Retention locks in **Compliance** mode can only be extended, and the retention period cannot be removed or reduced. You must wait for the lock to expire.
- **14.**Use the **Unit of Time** drop-down menu to select a unit of time for the default retention lock, then enter a value for **Number of Unit of Time**. The minimum value is 1 day and the maximum value is 36500 days (100 years).

15.Click Next.

16.Edit the example **Policy** code as required. Policy permissions are used if you want to exclude IAM user(s) under the main AWS account from accessing the Vail bucket.

Note: For additional information on configuring a policy, see the <u>Amazon S3 Actions</u> documentation.

Parameters	2 Policy	3 Lifecycle	Confirm
Block Public Policie	s 🕐 🔽 Restrict Public Bu	ickets ⑦	
<pre>3 "Id": "ExamplePoli 4 " "Statement": [6 " "Sid": "Exampl 7 "Effect": "All 8 "Principal": " 9 ~ "Action": [10 """ 12 ~ "Resource": [13 """ 14] 15] 16] 17]</pre>	cy01", eStatement01", w", ", ::examplebucket"		

Figure 47 The Create Bucket - Policy screen.

- **17.**If desired, select or clear **Block Public Policies**. Enabling this setting blocks new bucket policies that grant public access to buckets and objects. This setting does not change existing policies that allow public access.
- **18.**If desired, select or clear **Restrict Public Buckets**. Enabling this setting ignores public and cross-account access for buckets with policies that grant public access to buckets and objects.

19.Click **Next**.

- If you selected ACLs Disabled in Step 10 on page 89, skip to Step 26 on page 93.
- Otherwise continue with Step 20 below.

20.Click **Add ACL** to configure ACL bucket permissions. ACL permissions are used when the bucket is shared across AWS accounts, and when older applications are being used that are not compatible with bucket policies.

Parameters — Block Pul	— 🕑 Policy —— 🖪 blic ACLs 🔊 🔽 Igno	Access Control Lists	— 4 Lifecycle —	- 5	Confirm
lote: Maximum number of J	ACLs is 100.				
AWS Canonical ID					*
🗌 Read 🗌 Rea	d ACP 🗌 Write 🗌	Write ACP			Î

Figure 48 The Create Bucket - Access Control List screen.

- 21. Using the AWS Canonical ID drop-down menu, select an ID.
- **Note:** The ID of the Vail sphere administrator is automatically configured in the Spectra Vail application. To add additional AWS accounts, see Configure & Manage IAM Accounts.
- **22.**Using the **Permissions** check boxes, set the permissions for the Vail bucket. If desired, you can assign multiple permissions.

Option	Description	
Read	Allows the user to list the objects in a bucket.	
Read ACP	Allows the user to read the bucket ACL information.	
Write	Allows the user to create new objects in the bucket, and to overwrite existing objects.	
Write ACP	Allows the user to write the ACL for the bucket.	

If necessary, repeat Step 20 through Step 22 to configure additional ACLs.

Note: Use the trashcan icon to remove an ACL.

23.If desired, select or clear **Block Public ACLs**. Enabling this setting this blocks public access to ACL permissions applied to newly added buckets or objects, and prevents the creation of new public access ACLs for existing buckets and objects. This setting does not change any existing permissions that allow public access to S3 resources using ACLs.

- **24.**If desired, select or clear **Ignore Public ACLs**. Enabling This setting ignores all ACLs that grant public access to objects or directories.
- 25.Click Next.
- **26.** Using the **Select Lifecycle** drop-down menu, select a previously configured lifecycle and click **Next**.
- **Note:** If you are creating a linked bucket and want to use the linked bucket as destination storage in a lifecycle, select None. After the linked storage is created and added to a lifecycle, you need to edit the bucket to select the desired lifecycle. See Vail Sphere Configuration Paths on page 1 for more information.

Figure 49 The Create Bucket - Lifecycle screen.

27.Review the configuration, then click **Submit** to create the bucket.

Note: A Vail sphere is limited to 1000 buckets.

CONFIGURE AN OBJECT STORAGE BROWSER

Before you can access and transfer data to a BlackPearl S3 solution or Vail VM node, you must configure an object storage browser. The instructions in this section describe how to configure the S3 Browser and Cyberduck[®] cloud storage browser software.

Note: For other object browser programs compatible with the Spectra Vail application, refer to the documentation included with the software.

The instructions below assume you have previously installed the browser software.

Configure S3 Browser

Here is how to configure the S3 Browser:

1. Launch the S3 Browser software.

Note: You must use S3 Browser program version 9.0.8 or later.

- **2.** Click **Accounts > Add New Account**.
- **3.** Enter the desired **Account Name**.

53 Add Ne	w Account	_		×
	Add New Account		online h	elp

Figure 51 The Advanced S3-Compatible Storage Settings screen.

- 9. Using the Signature Version drop-down menu, select Signature V4 and click Close.
- **10.**Click **Add new account**. The S3 Browser retrieves the list of buckets configured on the Vail sphere (see View Vail Bucket Details on page 139.)

Configure Cyberduck Object Storage Browser

Here is how to configure Cyberduck object storage browser:

 Download and install the Cyberduck profile for third party S3 (HTTPS) connections. The profile can be downloaded at:

https://profiles.cyberduck.io/Spectra%20S3%20(HTTPS).cyberduckprofile

Note: Use the Cyberduck user documentation for help installing the profile.

- **2.** Launch the Cyberduck software.
- 3. Click Open Connection.

CONFIGURE & MANAGE SPHERE ADMINISTRATOR -CLOUD CONTROL

Spectra Vail application sphere administrator accounts have full control over the entire sphere, with full access to configure and change all system settings. Use the information in this section to create, edit, or delete a sphere administrator when using a cloud controlled Vail application.

Note: The Spectra Vail application relies on the AWS Cognito server to manage sphere administrators. As a result, it is also possible to make sphere administrator level changes via the AWS management console.

Create a Sphere Administrator

 In the upper right corner of the Vail management console, click the gear icon (1) and select Administrators (2).

Figure 54 The Dashboard screen - Navigation menu.

2. In the Sphere Administrator pane, click **Create**.

+ CREATE	Î DELETE	
Username	Email Address	
Administrator	kennethc@spectralogic.com	

Figure 55 The Sphere Administrators pane.

3. Enter the desired **Username**.

Spectra Logic suggests using the same naming convention as your corporate email for Vail sphere administrator names.

For example, if associate Jane Smith uses the email address janes@yourcompany.com, use "janes" for the user name.

Create Sphere Administra	itor 🕐 🗙
Username	Email Address
	A temporary password will be sent to this address
Select what types of emails this u	user wants to receive.
e electrinat ()pee el elliane ano a	
Info Ok Warning) 🗌 Error

Figure 56 The Create Sphere Administrator screen.

4. Enter the **Email Address** for the sphere administrator. Emails sent to this address include system events and the temporary password for the account.

5. Select the type(s) of emails that the sphere administrator receives. The Spectra Vail application emails the administrator when an event of the selected type occurs.

Setting	Description
Info	An expected event occurred such as a job starting or completing successfully.
ОК	A component of the Vail sphere reports an OK status.
Warning	Notifies the user of a failure that may adversely impact the Spectra Vail application.
Error	Notifies the user of a failure that caused significant adverse impact to the Spectra Vail application.

6. Click Submit.

A default password is emailed to the address entered in Step 4

Change a Sphere Administrator Password

 In the upper right corner of the Vail management console, click the gear icon (1) and select Administrators (2).

Figure 57 The Dashboard screen - Navigation menu.

Under the Sphere Administrator banner, (1) Select the row of the sphere administrator to edit, and (2) click Edit.

CONFIGURE & MANAGE VAIL ADMINISTRATOR - LOCAL CONTROL

Spectra Vail application administrator account has full access to configure and change all system settings. The Vail application administrator in a local control configuration is created and managed using the BlackPearl S3 solution user interface. The instructions in this section assume familiarity with the BlackPearl S3 solution and administrator login credentials.

Use the information in this section to create, edit, or delete a sphere administrator when using a cloud controlled Vail application.

Global Data Policy Acc	ess Control List

Figure 68 The New User dialog box.

- **3.** Enter the desired **Username** for the user. The Username cannot contain capital letters or spaces and is limited to 16 characters. The Username is used to identify the user in the Vail environment.
- **4.** Enter the user's **Full Name**.
- 5. Enter and confirm the desired **Password** for the user.
- **6.** If desired, enter the value for the **Session Timeout** in minutes. This value cannot exceed 999 minutes.
- 7. Select Administrator and Login User Access permissions.
- **8.** From the drop-down list, select a **Default Data Policy** for the user. If specified, the BlackPearl S3 solution uses the selected data policy for all buckets created by the user, unless a different policy is specified during bucket creation.
- **9.** Enter a value for the **Max Buckets** the user is allowed to create. The default value of 10000 is pre-entered.

10.Select or clear options for the **Global Bucket Access Control List**. These options give or deny permission for the user being created to perform the action described in the table below, for all buckets present on the BlackPearl S3 solution, as well as any buckets created at a future date.

Name	Description	
List	The user can see the bucket and can list the objects in a bucket.	
Read	The user can get objects and create GET jobs.	
Write	The user can put objects and create PUT jobs.	
Delete	The user can delete objects, but cannot delete the bucket.	
Job	user can modify or cancel jobs created by other users. The user can also ne details of jobs created by other users.	
	Note: All users can view all jobs, but by default, only the initiator of the job can see the full details of a job.	
Owner	The user receives full access to all buckets, including all permissions listed above.	

- **11.**If desired, under **Global Data Policy Access Control List**, select the check box to allow the user access to any data policy created on the BlackPearl S3 solution.
- **12.**Click **Create** to create the new user. The BlackPearl S3 solution generates a unique S3 Access ID and Secret Key for the user.

Change a Vail Administrator Password

- **1.** From the right side of the menu bar, select *Current User*> User Profile. The User Profile screen displays.
- **2.** Select **Action >Edit**. The Edit User Screen displays.

Edit User	0
Username	Administrator
Full Name	Administrator
Current Password	
New Password	
Confirm New Password	
Session Timeout	60
User Access	
Administra	tor 🗹 Monitor 🗹 Login
	✓ Save [©] Cancel

Figure 69 The Edit User dialog box.

- 3. If desired, edit the user's Full Name.
- **4.** If you are changing the password, enter the desired **New Password**, then **Confirm New Password**.

Note: The new password does not take effect until after you log out of the BlackPearl user interface.

- **5.** If desired, edit the value for the **Session Timeout** in minutes. This value cannot exceed 999 minutes.
- 6. Click Save.

Delete a Vail Administrator

- 1. From the menu bar, select **Configuration > Users**. The Users screen displays a list of all configured users and S3 groups (see Figure 1).
- **2.** Select the user you want to delete, and then select **Action > Delete**. A confirmation window displays.
- **3.** Click **Delete** to delete the user.
CONFIGURE & MANAGE IAM ACCOUNTS

Identity and Access Management (IAM) allows you to control access to resources by assigning permissions to users and groups that allow or deny access to a resource.

Note: When using IAM accounts, Spectra Logic recommends you carefully consider the security requirements associated with IAM accounts and IAM policies. See the following for more information.

<u>https://aws.amazon.com/blogs/security/category/security-identity-compliance/aws-identity-and-</u> access-management-iam/

Add an IAM Account

By default, an IAM account is created when the Spectra Vail application is configured and associated with the sphere. If you have additional IAM accounts and want the Spectra Vail application to access resources associated with other accounts, you can add them as IAM accounts in the Spectra Vail application.

There are two types of IAM accounts, AWS and Local. Use the sections below to add an IAM account:

- Add an AWS IAM Account below
- Add a Local IAM Account on page 112

Add an AWS IAM Account

Use the section below to add an AWS IAM account.

In the upper right corner of the Vail management console, click the gear icon (1) and select IAM Accounts (2).

Figure 70 The Dashboard screen - Navigation menu.

2. Under the IAM Accounts banner, click Add.

+ ADD	P EDIT		
ID	Username	Canonical ID	
070404000000	voil development		

Figure 71 The IAM Accounts pane.

3. Enter the **Role ARN**. The Role ARN is an IAM role that specifies what a user is allowed to do and is used by a user in one AWS account to assume a role in a different AWS account. The Role ARN can be found in the Role page of the AWS account to be added to the Vail sphere.

You must specify the AWS resource using the following format:

arn:partition:service:region:account:resource

Parameter	Description	
partition	Identifies the partition containing the resource. For standard AWS regions, the partition is aws . For resources in other partitions, use aws-partitionname .	
service	Identifies the AWS product. When configuring an AWS user in the Spectra Vail application, use the service name is iam .	
region	This parameter is not used when configuring an AWS user in the Spectra Vail application and must be left blank.	
account The full AWS account ID for the AWS account with no h This can be found on the My Account screen in the AWS management console.		
	Note: You cannot use an AWS account ID alias when configuring an AWS user in the Spectra Vail application.	
resource	The name of the specific resource.	

4. If desired, enter an **External ID**. The external ID is associated with the IAM role entered in Step 3 and is configured when a role is created in an AWS account. The External ID is required to assume the role created in Step 3. In the AWS management interface, the External ID can be found on the Roles section of the IAM screen, in the **Trusted relationships** tab.

VIEW CAPACITY INFORMATION

The Capacity page allows you to see data capacity information for the Spectra Vail sphere endpoints, each configured location, and cloud storage.

Note: Capacity values for BlackPearl storage display zeros until data is written to the storage.

In the Vail management console taskbar, click **Capacity**.

The Capacity screen is separated into three sections:

• The **Sphere Endpoint Physical Capacity** pane displays the combined total of all configured BlackPearl, Vail VM node, and cloud storage endpoints.

Figure 103 The Sphere Endpoint Physical Capacity pane.

Field	Description
Storage	The type of storage.
Used	The amount of space used for each storage type.
Optional	The amount of space used by the optional clones. There is a delay before this field is populated after creating storage.
Available	The available space used for each storage type. Note: Available capacity does not account for capacity used by file system overhead.

• The **Location Capacity** pane displays data capacity information for each configured location. Buttons in the top left of the pane allow you to view information for each location.

--------	-----	-----	----------	----------	-------

Field	Description
Storage	The name of the location.
Туре	The type of storage used for each location. Tape - Storage on tape media on a BlackPearl system. Volume - Storage on disk volume storage on a BlackPearl system.
Storage Class	The storage class used by the storage location.
Partitions	The BlackPearl data partition(s) that are used for storage.
Used	The amount of space used for each location.
Optional	The amount of space used for optional object clones.
Available	The available space used for each location. BlackPearl storage is over- provisioned, and may be used by multiple storage endpoints. Note: Available capacity does not account for capacity used by file system overhead.

• The **Cloud Capacity** pane displays aggregated data capacity information for each type of storage class used by cloud endpoints.

Figure 105 The Cloud Capacity pane.

VIEW PERFORMANCE METRICS

The Performance page displays data transfer and operation performance for the Vail sphere and all configured endpoints. The performance graphs display information in five minute or one day intervals.

In the Vail management console taskbar, click **Performance**.

Figure 106 The Performance screen.

- Use the **Endpoint** drop-down menu to select an endpoint for any graph on the Performance screen.
- Use the **Graph Type** drop-down menu to select which graph to display.
- Use the **Length** drop-down menu to select between intervals of five minutes or one day.
- Toggle the **Refresh** slider to refresh the display.

• To display the exact time and performance information, **mouseover** any point on a graph.

Figure 107 The Operations graph - mouseover.

VIEW VAIL BUCKET DETAILS

The buckets detail screen displays information about the selected Vail bucket, including bucket properties, ACLs, and policy.

Here is how to view the details of a Vail bucket:

- 1. In the Vail management console taskbar, click **Buckets**.
- **2.** Under the **Buckets** banner, select a bucket row, then click the **View Details** icon on the right side of the pane.
- **Note:** If you click the bucket name instead of the bucket row, the Bucket Contents pane displays. See View Vail Bucket Contents on page 143.

Buckets

Figure 109 The Bucket Details - Properties screen.

• If you click **Properties**...

Field	Description
Owner	The AWS Canonical ID of the Vail bucket owner. By default the Vail sphere administrator is the bucket owner.
Linked Storage	The name of the bucket on the BlackPearl system or AWS cloud storage location to which the Vail bucket is linked, if applicable.
Versioning	Indicates if versioning is enabled or disabled for the Vail bucket.
Object Locking	Indicates if object locking is enabled or disabled for the Vail bucket.
Encryption	Indicates if encryption is enabled or disabled for the Vail bucket
Compression	Indicates if compression is enabled or disabled for the Vail bucket.
Hide Glacier Operations	Indicates if hiding glacier operations is enabled or disabled for the Vail bucket.
Object Ownership	Indicates the type of object ownership configured for the bucket
Lifecycle	The lifecycle associated with the Vail bucket.
Creation date	The date the Vail bucket was created.
Default Retention Mode	Indicates if default retention mode is enabled or disabled for the Vail bucket
Default Retention Period	The retention time period configured for the bucket.

• If you click **Usage**...

Field	Description		
Number of Objects	The number of objects currently in the bucket.		
Total Size of Objects	The current size of all objects in the bucket, in GiB.		
Average Object Size	The current average size of the objects in the bucket, in GiB.		

• If you click **ACLS**....

Field	Description		
Block Public ACLs	Indicates if the Vail bucket blocks public ACLs.		
Ignore Public ACLs	Indicates if the Vail bucket allows public ACLs.		
AWS Canonical ID	The ID of a users configured with ACL permissions for the Vail bucket.		
Permissions	The ACL permission level for the user.		

• If you click **Policy**...

Field	Description			
Block Public Policy	Indicates if the Vail bucket blocks or allows public policies.			
Restrict Public Buckets	Indicates if the Vail bucket blocks or allows public buckets.			
Policy	The AWS policy information entered when the bucket was created displays.			

4. Click the **X** in the upper-right corner to close the window.

VIEW VAIL BUCKET CONTENTS

The buckets contents screen displays all objects in a Vail bucket. If versioning is enabled for the bucket, other versions of the current object can also be viewed.

Here is how to view the contents of a Vail bucket:

1. In the Vail management console taskbar, click **Buckets**.

Storage class		STANDARD
Last modified		Sep 02, 2022 1:27:02 PM
Restored until		
Legal hold		
Retention mode		
Retain until		

Figure 113 The Object Details - Properties screen.

Field	Description
Version	The UUID for the current version of the object.
Size	The object size on the storage target.
Owner	The AWS account name of the owner of the object.

Field	Description
Storage Class	The current storage class for the object.
	Note: The existence of a GLACIER clone does not necessarily cause the storage class of the object to change to GLACIER. If a non-GLACIER clone exists, (such as objects originally written to STANDARD storage) the object has a STANDARD storage class. This is true even if the STANDARD clone is optional.
Last Modified	The last modified date of the object.
Restored Until	The timestamp of when the object expires.
Legal Hold	Indicates if the object has a legal hold.
Retention Mode	Indicates the retention mode.
Retain Until	The duration that the object is retained by a legal hold.

ifecycle Status 🕐		None	
+ CREATE	VERIFY	DELETE	
Storage	Attributes ⑦	Storage Class	Optional
bpdemobucketto link (1.2)	archived	GLACIER	No

Click **Storage** to display the current storage information for the object.

Field	Description	
Lifecycle Status	Indicates what Lifecycle-based changes are scheduled for the object.	
Storage	orage The name of the storage endpoint where the object is stored.	
	If the object is 256 bytes or less after compression, it is stored in the application database and not on a storage endpoint. The storage field is blank when the object is stored in the database.	
	Note: If the object is stored in the database but the Lifecycle targets a linked bucket storage endpoint, the application clones the object to the storage endpoint to ensure the contents of linked buckets are synchronized.	
Attributes	Archived - The object is archived and must be restored in order to be accessed. Restored - The object is restored can be accessed.	
Storage Class	The current storage class for the object. See Storage Classes on page 269 for information on each storage class.	

Field	Description
	Note: The existence of a GLACIER clone does not necessarily cause the storage class of the object to change to GLACIER. If a non-GLACIER clone exists, (such as objects originally written to STANDARD storage) the object has a STANDARD storage class. This is true even if the STANDARD clone is optional.
Optional	If yes, the clone is deleted when space is required.

CREATE AN OBJECT CLONE

If desired, you can delete a clone of an object in a Vail bucket using the Vail management console. You can only create an object clone if the object does not exist on all storage targets. You cannot have multiple clones on the same storage target.

Here is how to create an object clone using the Vail management console:

1. In the Vail management console taskbar, click **Buckets**.

EDIT GLOBAL SETTINGS

If desired, you can edit the global settings of the Spectra Vail application to enable a diagnostic monitor or to change the nightly processing time used by the application.

Change Lifecycle Rule Nightly Processing Time

Here is how to change the nightly processing time:

- 1. In the upper right corner of the Vail management console, click the **gear icon** and select **Global Settings**.
- 2. Under the **Global Settings** banner, click **Edit**.

Edit Global Settings	×
Enable Diagnostic Monitor 🔊	
Nightly Processing	
00:00	UTC 👩
Configure AWS Infrastructure	
Namespace	
AWS Region	
AWS Access Key ID	
AWS Secret Access Key	
	CLIDMI

Figure 128 The Edit Global Settings screen.

3. Enter the new UTC time for **Nightly Processing**.

Notes: • Changing this value does not affect any actions that are already scheduled.

- All nodes must be rebooted after changing the Nightly Processing time.
- 4. Click Submit.

Enable Diagnostic Monitor

The diagnostic monitor allows the Spectra Vail application to send diagnostic data to Spectra Logic.

Note: Contact Spectra Logic Technical Support before enabling the diagnostic monitor.

- **1.** In the upper right corner of the Vail management console, click the **gear icon** and select **Global Settings**.
- 2. Under the Global Settings banner, click Edit.

Ear Clobal Octurige	^
Enable Diagnostic Monitor ⁽²⁾	
Nightly Processing	
00:00	UTC 👩
Configure AWS Infrastructure	
Namespace	
AWS Region	
AWS Access Key ID	
AWS Secret Access Key	

Figure 129 The Edit Global Settings screen.

3. Select **Enable Diagnostic Monitor**, then click **Submit**.

Configure AWS Infrastructure

For a local-control Vail sphere, configuring the AWS infrastructure settings is required in order to access AWS S3 buckets and to add IAM accounts in to the Vail application. Editing these settings assumes familiarity with your AWS environment.

Note: In a cloud-control Vail sphere, these settings are pre-populated and cannot be changed.

- **1.** In the upper right corner of the Vail management console, click the **gear icon** and select **Global Settings**.
- 2. Under the Global Settings banner, click Edit.

Euro Global Gettings	^
Enable Diagnostic Monitor ⁽²⁾	
Nightly Processing	
00:00	UTC 🕜
Configure AWS Infrastructure	
Namespace	
AWS Region	
AWS Access Key ID	
AWS Secret Access Key	

Figure 130 The Edit Global Settings screen.

- 3. Enter information for the Namespace, AWS Region, and AWS Access credentials.
- 4. Click Submit.

USING PROXY CONNECTIONS

If desired, you can configure the Spectra Vail application to use a proxy server to connect with external servers.

Configure Proxy Connection

Here is how to configure a proxy connection:

- 1. In the upper right corner of the Vail management console, click the **gear icon** and select **Network**.
- 2. Under the **Proxy Servers** banner, click **Create**.

Select Proxy Type		
Global		~
Hostname	Port	
Username	Password	

Figure 131 The Create Proxy Configuration screen.

- **Note:** You can only configure a Global proxy type. The **Select Proxy Type** drop-down menu is grayed-out and not functional.
- **3.** Enter the **Hostname** for the proxy server to use for external connections.
- **4.** Enter the **Port** of the proxy server.
- 5. Enter the **Username** and **Password** to use when connecting through the proxy server.
- 6. Click Submit.

Edit Proxy Server

All options available when creating a proxy connection can be changed by editing the connection.

Here is how to edit a previously configured proxy configuration:

- 1. In the upper right corner of the Vail management console, click the **gear icon** and select **Network**.
- 2. Under the **Proxy Servers** banner, select the proxy connection and click **Edit**.
- **3.** Update the proxy information as required, and click **Save**.

Delete Proxy Server

Here is how to delete a previously configured proxy configuration:

- In the upper right corner of the Vail management console, click the gear icon and select Network.
- 2. Under the **Proxy Servers** banner, select the proxy connection and click **Delete**.
- **3.** Update the proxy information as required, and click **Save**.

EDIT A VAIL BUCKET

If desired, you can edit Vail buckets to change various settings. You cannot change the bucket name, but all other settings used when creating a bucket are available when editing a Vail bucket, including encryption, versioning, access controls, and lifecycle selection.

- **Note:** Prior to Vail 3.2.0, you cannot disable versioning if the bucket was initially configured to use versioning AND object locking when it was created. Starting with Vail 3.2.0, you are now able to change the versioning setting if the Vail bucket was created to use versioning.
- **Note:** If you enable encryption on a bucket that is not currently configured to use encryption, only new data put to the bucket is encrypted. To encrypt existing data, you must use the PUT OBJECT copy command.

Here is how to edit a Vail bucket:

- 1. In the Vail management console taskbar, click **Buckets**.
- 2. Under the **Buckets** banner, select (1) the row of the bucket to edit, and (2) click **Edit**.

3. On the confirmation screen, click Delete.

VIEW STORAGE DETAILS

The storage detail screen displays advanced information about the storage endpoint, as well as data usage information.

Note: This section describes the storage details information displayed on a local-control, bucket storage BlackPearl S3 solution. Depending on the storage type you are viewing, the information may not match what you see in your Vail management console.

Here is how to view the details of storage:

- 1. In the Vail management console taskbar, click **Storage**.
- **2.** Under the **Endpoint Storage** or **Cloud Storage** banner, click the **View Details** icon to the far right of the storage for which you want to view details.

Data Policy	vail-1-1
Data Partitions	ISV4-Stack
Caution Threshold	70%
Warning Threshold	80%

Figure 140 The Storage Details - Properties screen.

Field	Description
ID	The assigned ID of the storage which is used to identify the storage in certain error messages.
Туре	The type of storage used on a BlackPearl or cloud storage endpoint.
Storage Class	The storage class used by the storage endpoint.
Status	The current status of the storage endpoint.

Field	Description
Third-Party Recovery	Indicates if the option to allow third party recovery is enabled or disabled. This option writes additional data per object which allows full objects to be generated from the storage endpoint.
Restore To New Clone	Indicates if the option to create a new clone on a different storage endpoint, rather than the existing endpoint, is enabled or disabled.
Bucket	The bucket used by the BlackPearl or cloud storage endpoint.
Data Policy	The data policy on the BlackPearl S3 solution used by the storage endpoint.
Data Partitions	The tape or disk partitions on the BlackPearl S3 solution used by the storage endpoint.
Caution Threshold	The percentage of used space before the Vail application generates a caution system message.
Warning Threshold	The percentage of used space before the Vail application generates a warning message.

Note: Depending on the type of storage, not all fields listed above display.

• If you select **Usage**...

820 MIB 🕐	
82 MiB	
	10 820 MiB 820 MiB ⑦ 82 MiB

Figure 141 The Storage Details - Usage screen (Tape storage shown).

Field	Description
Number of clones	The number of clones kept by the storage endpoint for each object.
Total size of clone content	The total size of clones on the storage endpoint.
Total stored size of all clones	The amount of data used by the clones on the storage endpoint. Because clones are compressed before they are written to storage, this value may be different from the original content size.
Total size of optional data	The amount of optional data stored on the storage endpoint. The Vail application only uses optional data to improve performance when there is sufficient storage space available. Optional data is automatically deleted when additional space on the storage endpoint is required to store non- optional data. Note: This option only displays for Volume storage endpoints.
Average clone size	The average size of all clones on the storage endpoint.

EDIT BLACKPEARL OR VAIL VM ENDPOINT

If desired, you can edit the BlackPearl S3 solution or Vail VM Node endpoint to change the location of the system in the Vail sphere, enable debug logging, or adding additional host names that can be used to access the endpoint.

Change Endpoint Location

Here is how to change the regional location of an endpoint:

- **1.** In the Vail management console taskbar, click **Storage**.
- **2.** Under the **Endpoint Storage** banner, (**1**) select the row of the endpoint and (**2**) click **Edit**.

ectra vall [*] Single Node BP-Phoenix		~ U		listia

Figure 151 The Edit Endpoint Storage - Parameters - BlackPearl screen.

4. If desired, select to enable **Third-Party Recovery**. This option creates a clone for delete markers, 0-length objects, and tiny objects, even though those clones are unnecessary. It also enables storage of full object metadata, which allows you to generate full objects from the content on the storage endpoint.

Note: This option uses additional storage space and negatively affects performance.

5. If desired, select to enable **Restore to New Clone**. This option creates an additional data clone of objects on the storage endpoint to a different storage endpoint.

6. Click Next.

7. Review the configuration and click **Submit**.

Edit BlackPearl Volume Pool Storage

Here is how to edit BlackPearl volume pool storage:

- **1.** In the Vail management console taskbar, click **Storage**.
- 2. Under the Endpoint Storage banner, (1) select the row of the storage and (2) click Edit.

5. If desired, select to enable **Third-Party Recovery**. This option creates a clone for delete markers, 0-length objects, and tiny objects, even though those clones are unnecessary. It also enables storage of full object metadata, which allows you to generate full objects from the content on the storage endpoint.

Note: This option uses additional storage space and negatively affects performance.

- **6.** If desired, enter a value for a **Quota**, and use the **Units** drop-down menu to select a unit size for the quota value. This setting controls the maximum amount of storage space on the storage pool that is used for the BlackPearl volume pool storage endpoint. When this percentage is reached, no additional data is added to the storage endpoint. If you do not want to use a quota limit, leave the fields blank.
- 7. Click Next.
- **8.** Review the configuration, and click **Submit** to save the changes to the BlackPearl storage.

Edit Vail VM Node Storage

Here is how to edit Vail VM node storage:

- 1. In the Vail management console taskbar, click **Storage**.
- 2. Under the **Endpoint Storage** banner, select the row of the storage and click **Edit**.
- 3. If desired, edit the Storage Name.

- c. If desired, you can change the Access Key and Secret Key information.
- **d.** If desired, select **Skip TLS Verification**. This option disables TLS certificate verification for HTTPS endpoints.

Note: This setting does not apply to HTTP endpoints.

- e. Click Next.
- **f.** Review the configuration, and click **Submit** to save the changes to the cloud storage.

CONSOLIDATE STORAGE

The consolidate storage function performs two tasks, consolidation of data packs and consolidation of metadata packs. Both tasks run when you consolidate storage, you cannot run one task separately.

Consolidate Storage Pack

This option is useful if you have deleted a large number of object clones and want to consolidate the partial data packs. The consolidate storage pack task runs everyday automatically at the scheduled daily processing time. You only need to consolidate storage packs manually if you do not want to wait for the daily processing schedule.

Consolidate Metadata Packs

This option is useful if you have third-party recovery enabled. The third-party recovery option writes daily metadata packs for use in recovering your data outside of the Vail environment. These metadata packs accumulate over time, so the consolidation of metadata packs merge these packs into the smallest number of metadata packs possible.

Note: The consolidate storage feature may take a long time depending on the number of objects.

Here is how you consolidate storage:

- 1. In the Vail management console taskbar, click **Storage**.
- Under the Endpoint Storage or banner, (1) select the row of the storage, and (2) click Consolidate.

😑 Endpoint Storage 🗢				
	2

Name	Туре	Storage Class	Status	
T BPS2-S3-ISV4 (https://bps2-s3-isv4.fishbowl.com)	BlackPearl		ок	

Figure 170 The Endpoint Storage pane.

3. On the confirmation screen, click **Consolidate**.

Note: The consolidate storage feature may take a long time depending on the number of objects.

DELETE STORAGE

When you delete storage, you can select to delete all data on the storage, or to move data to alternative storage.

CAUTION

If you select **Delete All Data**, any object clone that is **only** persisted on the storage is <u>permanently</u> deleted and <u>cannot</u> be recovered.

If you select **Choose Alternative Storage**, any object clone that exists only on the storage to be deleted is moved to the specified alternate storage. After all unique objects are moved, the storage is deleted.

To make sure you do not lose any data unintentionally, it is recommended to select **Choose Alternative Storage** and allow the Spectra Vail application to migrate any necessary data to alternative storage.

Note: You cannot delete storage that contains the only clone of a locked object.

Here is how to delete endpoint storage or cloud storage and optionally move data to alternative storage:

- 1. In the Vail management console taskbar, click **Storage**.
- Under the Endpoint Storage or Cloud Storage banner, (1) select the row of the storage, and (2) click Delete.

------------	---------------	----------------	------------	---------

Field	Description
Description	The text, if any, entered in the Description field when creating the bucket.
Upload Expiration	The number of days that must pass before a multipart upload is aborted. When a multipart upload is aborted, it deletes all parts associated with the upload, which prevents remaining incomplete uploads from being stored.
Marker Expiration	Indicates if the Delete Marker Expiration option is Enabled or Disabled .
Force Initial Copy	Indicates if the lifecycle is configured to initially place data as STANDARD storage. Additional clones are created immediately as GLACIER storage.
lgnore Storage Class	Indicates if the lifecycle is configured to ignore the storage class requested in a PUT or upload operation and instead use the configured storage class of the selected storage endpoint.
Modified	The date and time the lifecycle was last modified.

• The Rules screen:

lifecycle1			×

Versions		Latest	
Include			
Exclude			

Field	Description
Name	The name of the lifecycle.
Туре	The type of lifecycle rule. Values: Clone, Move, Expiration.
Apply After	The number of days before the lifecycle rule is applied.
Destinations - Count	The number of destinations configured for the lifecycle. Values: 1-5, All.
Destinations - Storage	The storage endpoint(s) used by the lifecycle.
Destinations - Delete	Whether or not the lifecycle is configured to delete clones on storage destinations that are not configured in the lifecycle.
Filters - Versions	The versioning setting configured for the lifecycle.
Filters - Include	The text string used to filter objects to include in storage operations.
Filters - Exclude	The text string used to filter objects to exclude from storage operations.

EDIT A LIFECYCLE

If desired, you can edit a lifecycle to change how it controls data movement and retention. All settings used when creating a lifecycle are available when editing a lifecycle.

Here is how to edit a lifecycle:

- 1. In the Vail management console taskbar, click Lifecycles.
- **2.** Under the **Lifecycles** banner, (1) select the lifecycle to edit, and (2) click **Edit**.

+ CREATE	DELETE		
Lifecycle Name	Modified	Number of Rules	
Copy Rule to Cloud	Jul 06, 2021 5:05:32 PM	1	Ŀ

Ignore Requested	ed Storage Class ⑦	
Description		

Figure 179 The Edit Lifecycle - Parameters screen.

- **4.** If desired, select or clear **Force Initial Copy**. When enabled, the Vail application initially places data as STANDARD storage. Additional clones are created immediately as GLACIER storage. This may provide performance advantages as copying clones to GLACIER results in a clone that is ordered sequentially and more optimally packed.
- **5.** If desired, select or clear **Ignore Requested Storage Class**. When enabled, the Vail application does not consider the storage class requested in a PUT or upload operation and instead uses the storage class of the selected storage endpoint.

6. Click Next.

Figure 180 The Edit Lifecycle - Rules screen.

- Use the links below to create or edit lifecycle rules.
 - Add a Placement Rule on page 80
 - Add a Deletion Rule on page 83
- To delete a lifecycle rule, click the **trash can icon**.

Note: There is no confirmation step for this action.

7. After making the desired changes, click **Submit**.

DELETE A LIFECYCLE

If desired, you can delete a lifecycle when its data placement schema is no longer needed.

Note: You cannot delete a lifecycle currently being used by a Vail bucket.

Here is how to delete a lifecycle:

- **1.** In the Vail management console taskbar, click **Lifecycles**.
- **2.** Under the **Lifecycles** banner, (1) select the lifecycle to delete, and (2) click **Delete**.

<pre> C Lifecycles ♥ </pre>

toBP	Jul 01, 2021 10:40:13 AM	1	C

Figure 181 The Lifecycles pane.

3. A confirmation screen displays. Click **Delete** to confirm deleting the lifecycle.

CREATE A LOCATION

Locations are used to identify sites on the dashboard world map as well as to group storage endpoints by their physical location. Locations are only used in a cloud-control Vail sphere. These screens do not display in a local-control Vail sphere.

Note: You can also create a location when registering a BlackPearl node, or Vail VM node with the Vail sphere.

Here is how to create a location:

1. In the upper right corner of the Vail management console, click the **gear icon** (**1**) and click **Locations** (**2**).

SP	ECTRA	Spectra Vail [®] blackpearl-NYC	1 2 0	Administrator
î	Dashboard	⊟ Sphere Status	Adm	Accounts
=	Storage	Total 0 Bytes		Users & Groups
φ	Lifecycles	Endpoints: 1 Logging Process:		ations 2

Address Search		
		NEXT

Figure 184 The Add Location - Address Lookup screen.

- To search for a location...
 - **a.** In the **Address Search** field, enter a geographic location. You can enter a full or partial postal address, city, county, province, or country. Select the correct match from the list and click **Next**.
 - **Note:** If no match is located, try changing the format of the address you entered. For example, use 9th Street in place of Ninth St.
 - **b.** Confirm the information is correct, or edit as needed, and click **Submit**.

- To manually enter a location...
 - a. Click Next.

		×
Address Lookup —	Confir	mation
Prease confirm the detail populated fields or return Note: Latitude and Longitude v Namo	is below. If necessary, you may edit any pre- n to the previous page and execute another se alues are used for the System View map on the dashboar	earch.
Indille		
Latitude	Longitude	

Figure 185 The Add Location - Manual Entry screen.

a. Enter the desired **Name**.

Spectra Logic recommends naming each location after its physical location in the world.

For example, if Vail resources are located in Dallas, use that as the location name if there is only one Vail resource in that city. If there are multiple Vail resources consolidated in the same city, use suffixes to identify each group such as Dallas-HQ, Dallas-Research, or Dallas-Production.

- **b.** Enter the **Latitude** and **Longitude** of the location.
- **Notes:** When entering a value for **Latitude**, use positive values for locations north of the equator, and negative values for locations south of the equator.
 - When entering a value for **Longitude**, use positive values for locations east of the prime meridian, and negative values for locations west of the prime meridian.
 - c. Click Submit.
- To skip entering a location...
 - a. Click Next.
 - **b.** Enter the desired **Name** and click **Submit**.

The new location now displays on the world map on the Dashboard.

Note: If you do not enter an address or latitude and longitude, the location displays on the righthand pane of the dashboard, but does not display on the world map.

DELETE A LOCATION

Locations are used to identify sites on the dashboard world map as well as to group storage endpoints by their physical location. If desired, you can delete a location that is no longer in use. Locations are only used in a cloud-control Vail sphere. These screens do not display in a local-control Vail sphere.

Here is how to delete a location:

In the upper right corner of the Vail management console, click the gear icon (1) and click Locations (2).

Figure 186 The Dashboard screen - Navigation menu.

- **2.** Select the row of the location you want to delete and click **Delete**.
- **3.** On the confirmation screen, click **Delete** to delete the location.

CLEAR THE IAM CACHE

The Spectra Vail application maintains an IAM (Identity and Access Management) cache independent from the cache maintained by Amazon Web Services. When users make IAM changes, AWS sends a notification to the Spectra Vail application, but the Vail management console may not update immediately. Clearing the Spectra Vail application IAM cache deletes the current information and causes the Spectra Vail application to retrieve all IAM information from AWS.

Additionally, clear the IAM Cache if you make security changes to or create a new set of IAM credentials in the AWS management console and want them to immediately display in the Vail management console.

Note: It may take several minutes for AWS security changes to take effect. Spectra Logic recommends waiting approximately 3-5 minutes after making changes before clearing the IAM cache, or updated settings may not display.

Here is how to clear the IAM cache:

- 1. In the upper right corner of the management console, click the **gear icon** and select **IAM Users & Groups**.
- 2. In the IAM Users pane, click Clear Cache.
- **3.** In the confirmation window, click **Clear Cache**.

VIEW REPORTS

The Reports screen allows you to view any existing audit logs for the Spectra Vail application, and detailed information for each audit log.

• In the Vail management console taskbar, click **Reports**.

SP	ECTRA	Vail Sphere	🌣 🌲 💄 Adminis	strator

VIEW SPECTRA VAIL APPLICATION MESSAGES

Spectra Vail application messages provide important information about the status and current functionality of the Vail sphere. If desired, you can configured sphere administrators to receive messages automatically.

Note: The Spectra Vail application does not generate a message when an AWS cloud storage target is unavailable for backup operations. Some third-party applications may report this event as a warning message in their user interface.

Here is how to view messages:

In the upper right corner of the management console, click the **bell icon**. The value to the left of the icon indicate the number of unread messages.

Figure 189 The Bell icon.

- To delete an existing logset, select the row of the logset and click **Delete**.

UPDATE THE SPECTRA VAIL APPLICATION SOFTWARE

Use the instructions below to update the Vail sphere software, and the software that storage endpoints use to communicate with the Vail sphere.

Each component must be updated separately, and each component update must be initiated manually. Components include the Vail sphere, BlackPearl S3 solution and Vail VM nodes.

Note: The software running on the BlackPearl system is not updated using this process. See the <u>BlackPearl Nearline Gateway User Guide</u> for instructions on updating BlackPearl software.

In general, update the Spectra Vail application software in the *following order*:

- Vail sphere software
- BlackPearl software
- Vail VM Node software
- **Note:** Spectra Logic recommends checking the Vail Release Notes for any changes to the update order that may be required for specific Vail release versions.

Here is how to update the Vail sphere or endpoint software:

 In the upper right corner of the management console, click the gear icon and select Software Updates.

SPECTRA	Spectra \	Vail [®] zzzz			🜲 🔹 😧 🔺 Administrator
↑ Dashboard	ې Software U	pdates			
🚞 Storage		UPLOAD			
🗘 Lifecycles	Name	Туре	Status	Current Version	Available Version

	vail	Virtual Machine	ОК	3.0.0-6738	-

Figure 193 The Software Updates screen.
To update using the online package sever...

a. Select the row of the component you want to update and click **Update**.

Figure 194 The Update screen.

b. Click **Update**. The update process for the selected component begins.

IMPORTANT Do not reboot or power-cycle the BlackPearl S3 solution or Vail VM node during the update process or the BlackPearl S3 solution or Vail VM node fails to initialize.

Note: Depending on what component is being updated, the Vail management console may display a lost communication error while the component updates.

To update using a local file...

a. Select the row of the component you want to update and click **Upload**.

Figure 195 The Upload screen.

- **b.** Click **Choose File**, then browse to the archive update file.
- **c.** Click **Upload**. The file is uploaded and the update process for the selected component begins.

IMPORTANT Do not reboot or power-cycle the BlackPearl S3 solution or Vail VM node during the update process or the BlackPearl S3 solution or Vail VM node fails to initialize.

Note: Depending on what component is being updated, the Vail management console may display a lost communication error while the component updates.

ACCESSING THE TECHNICAL SUPPORT PORTAL

The Spectra Logic Technical Support portal provides access to the Knowledge Base, the current version of Vail software, and additional service and support tools. You can also open or update a support incident and upload log files.

Create an Account

Access to *User Guides* and compatibility matrices does not require you to create an account. You must create a user account and log in to access *Release Notes*, to download the latest version of Vail software, or to open a support incident.

- **Note:** If you have multiple Spectra Logic products, the serial numbers for all products will be associated with your account. If you do not see the serial numbers for all of your products when you log in, contact Technical Support (see Contacting Spectra Logic).
- 1. Access the Technical Support portal login page at *support.spectralogic.com*.
- 2. On the home page, click **Register Now**.

Figure 196 The Spectra Logic Technical Support portal home page.

- **3.** Enter your registration information. Your account is automatically associated with the serial numbers of all Spectra Logic products owned by your site.
- If you have an invitation, follow the link and enter the invitation code.

Figure 197 The Signup screen.

• If you do not have an invitation, enter the requested information to create your account. When you are finished, click **Submit**.

When the account is approved, you receive an email with an initial password. Use your email address and the password provided in the email to log in to your account. After you log in, you can change your password if desired.

Log Into the Portal

- 1. Access the Technical Support portal login page at *support.spectralogic.com*.
- **2.** Use your email address and password to log into the Technical Support Portal.

OPENING A SUPPORT TICKET

You can open a support incident using the Spectra Logic Technical Support portal or telephone.

- To contact Spectra Logic Technical Support by telephone, see Contacting Spectra Logic.
- Use the following instructions to open a support incident through the portal:

Figure 198 The Spectra Logic Technical Support portal home page.

- **1.** Make notes about the problem, including what happened just before the problem occurred.
- **2.** Gather the following information:
 - Your Spectra Logic customer number
 - Company name, contact name, phone number, and email address
 - The software serial number
 - Type of host system being used
 - Type and version of host operating system being used
 - Type and version of host storage management software being used
- 1. Access the Technical Support portal login page at *support.spectralogic.com*.
- **2.** If necessary, log in to the Support Portal by clicking **Login**, enter your **email address** and **password**, and click **Log in**.
- **Note:** See Create an Account on page 219 if you have not previously created an account on the Technical Support portal.

- **3.** Submit a support incident.
- Use the following instructions to search for help before submitting a ticket, or skip to Submit an Incident Directly on page 224.
 - i. From any page, select Incident>Incidents & Inventory.

Figure 199 Select Incidents>Incidents & Inventory.

VIEW THE STATUS OF THE BLACKPEARL SYSTEM

Use the sections below to view the status of multiple aspects of the BlackPearl system.

View System Overview

The Overview pane provides a quick look at the most critical aspects of the BlackPearl system.

Figure 206 The Overview pane.

- **1.** The BlackPearl system cache capacity and percentage of used cache space.
- 2. The capacity of the BlackPearl system database and percentage of used space.
- **3.** The capacity of all disk-based storage connected to the BlackPearl system and percentage of used space.
- **4.** The capacity of all tape-based storage in the tape library connected to the BlackPearl system and percentage of used space.
- **5.** The number of active jobs running on the BlackPearl system.

Mouse-over the green section of any percentage graph to display the amount of used space, and over the gray section to display the amount of remaining space.

Figure 207 Mouse-over a graph to view specific details.

View Notifications

Notifications provide information about errors that occur on the system, caution messages that alert you to issues that may impact your workflow, and informational messages. Additionally, notifications may provide troubleshooting advice to help you resolve issues that may occur.

Figure 215 The Tape Partitions pane - main view.

- 1. Each percentage graph displays both the used and remaining space for the associated type and generation of media present in the tape partition. Mouse-over the green section of any percentage graph to display the amount of used space, and over the gray section to display the amount of remaining space.
- **2.** Use the slider to change the display a graph of the current state of each tape cartridge present in the partition.
- **3.** Use the **Filter** button to select which pools to display on the Tape Partitions pane.

If you need to service the tape library, you can put a tape partition into a standby state. See Put a Tape Partition into Standby on page 240 for more information.

View Tape Partitions - Tape State View

The Tape Partitions pane displays information about the tape partitions configured on the tape library attached to the BlackPearl system. The Tape Partitions pane features both a main view and a tape cartridge state view.

To display the tape cartridge state view, manipulate the slider (2) to the right position.

பு put on standby		2→■ =
	1 1 1 1 1 1 1 1 1	3

Figure 216 The Tape Partitions pane - main view.

- **1.** The state of all tape cartridges in the partition. Each state combines different generations of tape media if present. Mouse-over any part of the graph to display more detailed information.
- **2.** Use the slider to change the display a graph of the current state of each tape cartridge present in the partition.
- **3.** Use the **Filter** button to select which pools to display on the Tape Partitions pane.

If you need to service the tape library, you can put a tape partition into a standby state. See Put a Tape Partition into Standby on page 240 for more information.

View Tape Drives

The Tape Drives pane displays information about all tape drives installed in the tape library connected to the BlackPearl system.

	FLINE						
(1)	(2)	3	(4)	(5)	(6)	(7)	(8)

416975L5	Normal	Normal	No	SpectraApp1		

Figure 218 The Tape Management pane.

- **1.** The physical barcode label on the tape cartridge.
- **2.** The current state of the tape cartridge.
- 3. Indicates if the tape is configured for use as a **Normal** or **Test** tape.
- **4.** The physical **Write Protected** status of the tape cartridge.
- **5.** The name of any BlackPearl system bucket(s) present on the tape cartridge.
- 6. Displays the timestamp of the last tape verification.
- **7.** Click the **Details** button to display additional information about the selected tape cartridge.
- **8.** Use the **Search** entry field and **Search By** drop-down menu to find a specific tape cartridge.

See one of the following sections for instructions to export, verify, or online a tape cartridge:

- Export a Tape Cartridge on the next page
- Verify a Tape Cartridge on page 238
- Online a Tape Cartridge on page 238

DASHBOARD ACTIONS

In addition to displaying information about the BlackPearl system, the embedded dashboard allows you to perform the most frequently-used actions as described in the sections below.

Create a Volume Snapshot

A volume snapshot is an image of a volume's configuration and data makeup as they were when the snapshot was generated. Restoring to a previously created snapshot allows you to go "back in time" and restore the volume to the state it was in when the snapshot was created.

See Volume Snapshots on page 1 for more information.

Here is how to create a volume snapshot:

- 1. In the BlackPearl dashboard, navigate to the **Volumes** pane.
- 2. Select the volume for which you want to create a snapshot.
- 3. Click Snapshot.
- **4.** If desired, edit the pre-generated **Snapshot** name.

Create Snapshot	×
Create a snapshot	
Snapshot vol552_snap_2023-09-08-14:30:43	
	SUBMIT

Figure 219 The Export Tape dialog box.

5. Click Submit.

Export a Tape Cartridge

Exporting a tape cartridge prepares it for physical removal from the attached tape library. In a Spectra Logic tape library, the cartridge is moved from the storage pool to the Entry/Exit pool, before it is physically exported from the library at the library front panel.

- 1. In the BlackPearl system dashboard, navigate to the **Tape Management** pane.
- 2. Select the tape you want to export.
- 3. Click Export.

4. If desired, edit the **Export Label** and **Export Location**.

xporting this tape will	render all data on this tape unavailable for download
ntil it is imported again	1.
Export Label	Export Location

Figure 220 The Export Tape dialog box.

5. Click Submit.

Online a Tape Cartridge

Setting a tape cartridge to "online" prepares the cartridge for use by the BlackPearl system. This allows the system to use the tape cartridge for data storage operations.

Here is how to online a tape cartridge:

- 1. In the BlackPearl system dashboard, navigate to Tape Management.
- 2. Select a tape in the **Offline** state.
- 3. Click Online Tape.
- 4. Click Submit.

Verify a Tape Cartridge

The BlackPearl system can perform a data integrity verification of all data on a selected tape cartridge to confirm it is still viable. While the verification is in progress, client access has priority over the data integrity scan.

Here is how to verify a tape cartridge:

- 1. In the BlackPearl system dashboard, navigate to Tape Management.
- **2. Select** the tape you want to verify.
- 3. Click Verify Tape.
- 4. Click Submit.

Change Job Priority

If desired, you can change the priority of an active job on the BlackPearl system.

Here is how you change the priority of a job:

- 1. In the BlackPearl system dashboard, navigate to the **Jobs** pane.
- 2. If necessary, click **Active** to display the list of active jobs.
- **3. Select** the job for which you want to change priority.
- 4. Use the **drop-down** menu to select a new priority for the job.
- 5. Click Submit.

Create a Bucket

Buckets on the BlackPearl system are data transfer targets for read and write operations. When you create a new bucket on the system, you assign it a owner and a data policy. You can then use the new bucket in your other Spectra software applications as a target for data storage on the BlackPearl system.

Here is how you create a new bucket:

- 1. In the BlackPearl system dashboard, navigate to the **Buckets** pane.
- 2. Click Create.
- 3. Enter a Bucket Name.

Create Bucket	×
Bucket Name	
Administrator	Backup •
	SUBMI

Figure 221 The Create Bucket dialog box.

- **4.** Using the **User** drop-down menu, select an owner for the bucket.
- **5.** Using the **Policy** drop-down menu, select a data policy for the bucket.
- 6. Click Submit.

Start a Storage Pool Verification

The BlackPearl system can perform a data integrity verification of all data on a selected storage pool to confirm it is still viable.

Here is how to start data verification on a storage pool:

- 1. In the BlackPearl system dashboard, navigate to the **Pools** pane.
- 2. Select the pool that you want to verify.
- **3.** Click **Start Verification**.
- 4. Click Submit.

Put a Tape Partition into Standby

If you need to perform service on the tape library associated with your BlackPearl gateway, or with the BlackPearl gateway itself, you must first put the tape library into a standby state. Otherwise, the BlackPearl gateway may attempt to use the tape library while it is in service.

Note: After the tape partition is placed in standby, any currently running tape operations continue until they are complete, which may take 30 minutes or longer.

Here is how to out a tape partition into standby:

- 1. In the BlackPearl dashboard, navigate to the Tape Partitions pane.
- **2.** Select the partition you want to set to standby.
- 3. Click Put On Standby.
- 4. Click Submit.

Offline a Tape Drive

If a tape drive is experiencing errors and needs to be physically replaced, the drive can be taken offline to prevent the BlackPearl system from using the drive for data storage operations until the replacement is complete.

Here is how to offline a tape drive:

- 1. In the BlackPearl system dashboard, navigate to the **Tape Drives** pane.
- 2. Select the drive you want to offline.
- 3. Click Take Offline.
- 4. Click Submit.

APPENDIX B - CREATE AND CONFIGURE A VAIL VM NODE

This chapter describes the creation and configuration steps for a Vail VM Node.

Create a Vail VM Node	
Vail VM Node Host Requirements	
Create a Node Using VMWare vSphere	
Create a Node Using Oracle VirtualBox	
Configure the Vail VM Node Network Settings	
Configure Network Settings	
Configure the Vail VM Node Hostname	
Configure the SSL Certificate	
Register a Vail VM Node with a Vail Sphere	262

CREATE A VAIL VM NODE

Using a Vail VM node is useful when you want on-premise Standard or Standard_IA class storage.

The instructions in this section describe setup of a Vail VM node using a VMDK file. A Vail VM node can also be created using an OVA file. Contact Spectra Logic for assistance.

Vail VM Node Host Requirements

A Vail VM node requires the following:

- 8 core CPU or higher
- 16 GB RAM or higher
- 10 GigE Ethernet network connection or higher
- A network that allows access to port 443 to allow for data transfer

Router Requirements

IMPORTANT All Vail VM nodes must be able to see each other using their announced IP address or hostname.

You may need to adjust the settings of any firewalls or proxy servers in your environment for the Vail VM nodes to communicate with each other. Contact your system administrator for assistance.

Port Requirements

All Vail VM nodes must be on a network that allows access on port 443.

VM Instance Protection

Spectra Logic recommends creating Vail VM nodes on reliable host computers and establishing a strong data protection system for your VM instances including regular snapshots to be used in the event of disaster recovery.

Note: Contact Spectra Logic for assistance configuring a Vail VM node with other virtual machine software such as Fusion, or Synology.

Create a Node Using VMWare vSphere

Here is how to create a Vail VM node using a VMDK file using VMWare[®] vSphere. These instructions are specific to vSphere and require familiarity with VM software.

- **1.** If the Vail VM image file was provided to you by Spectra Logic, skip to Step 2. Otherwise, download the latest Vail VM node image:
 - **a.** In the Vail management console, click the **gear icon**, then **Software Updates**.

b. Click Download VM Image.

Note: The file size is approximately 800 MB.

- **2.** After the download completes, unpack the file.
- **3.** Launch the VMWare vSphere application.
- **4.** In the **Navigator** pane, select the host on which to create the VM node.

Figure 222 The VMWare vSphere home screen.

- **5.** From the title bar, select **Actions > New Virtual Machine**.
- 6. In the New Virtual Machine wizard, select Create a new virtual machine and click Next.

7. Enter a Name for the VM node, select a Location , and click Next.

- **22.**When the VM boot completes, press **Enter**. If a DHCP server is configured, the IP address of the Vail VM node displays.
- **Notes:** Do not close the VM window.
 - If no DHCP server is configured, contact Spectra Logic Professional Services to set a manual IP address.
 - You can change the network configuration of the Vail VM node after logging into the Vail VM management console.

Figure 234 The Vail VM command line screen.

23.Open a web browser and enter the IP address. You are automatically logged in to the Vail VM user interface.

Note: The Vail VM node management console does not require any login credentials at this time.

Create a Node Using Oracle VirtualBox

Here is how to create a Vail VM node using a VMDK file using Oracle VirtualBox. These instructions are specific to the Windows version of Oracle VirtualBox and require familiarity with VM software.

- **1.** If the Vail VM image file was provided to you by Spectra Logic, skip to Step 2. Otherwise, download the latest Vail VM node image:
 - **a.** In the Vail management console, click the **gear icon**, then **Software Updates**.
 - **b.** Click **Download VM Image**.

Note: The file size is approximately 800 MB.

- 2. After the download completes, unpack the file.
- **3.** Launch Oracle VirtualBox.

4. Click New.

28. In the Oracle VM Manager main window, select the VM, and click Start.

Figure 244 The VM Settings - Storage screen.

- **29.**When the VM boot completes, press **Enter**. If a DHCP server is configured, the IP address of the Vail VM node displays.
- **Notes:** Do not close the VM window.
 - If no DHCP server is configured, contact Spectra Logic Professional Services to set a manual IP address.
 - You can change the network configuration of the Vail VM node after logging into the Vail VM management console.

Figure 245 The Vail VM command line screen.

30.Open a web browser and enter the IP address. You are automatically logged in to the Vail VM user interface.

Note: The Vail VM node management console does not require any login credentials at this time.

CONFIGURE THE VAIL VM NODE NETWORK SETTINGS

If desired, use the instructions in this section to edit the Vail VM node IP address, hostname, and SSL certificate.

If your Spectra Vail application is running on a BlackPearl system, the network settings for IP addressing, SSL certificates, and hostname are controlled by the BlackPearl system. See the *BlackPearl Nearline Gateway User Guide* for information.

IMPORTANT Spo

Spectra Logic recommends setting a static IP address and changing the hostname as described in the sections below.

Use one of the sections below to configure network settings.

- Configure Network Settings on the next page
- Configure the Vail VM Node Hostname on page 260
- Configure the SSL Certificate on page 261

Configure Network Settings

Here is how to configure the Vail VM node IP address:

- 1. In the upper right corner of the Vail management console, click the **gear icon** and select **Network**.
- 2. Select the interface adapter row and click **Edit**.

Configure your Network S	Settings			
IPv4 Mode		IPv6 Mode		
Manual	• ?	Automatic		• ?
Static Addresses +				
IP Addresses		Pr	efix Lengt	h 🕐
192.168.12.231		24	ļ	Î
Pv4 Default Gateway 192.168.12.1				0
Pv6 Default Gateway fe80::1a58:80ff:fec2:c57f				0
итu 1500				
🔿 DHCP 💿 Manual				
- Name Servers		Search Domains —		
192.168.12.1 fe80::1a58:80ff:fec2:c5	7f	lan		

Figure 246 The Vail VM Node Edit Network screen.

By default, DHCP is selected on the Edit Network screen to provide the IPv4 address. However, Spectra Logic recommends configuring a static IPv4 address.

Note: If you require the Vail VM node to be configured using a DHCP address, Spectra Logic recommends you use your DHCP server to bind the IP address to the Vail VM node.

- To configure the IP address manually,
 - a. Using the IPv4 Mode and IPv6 Mode drop-down menus, select Manual.
 - a. Edit the IPv4 and IPv6 IP Addresses as required.
 - **b.** Enter a value for the **Prefix Length**.

Note: To add a new IP address, click the + sign. To remove an IP address, click the **garbage can** icon.

- c. Edit the IPv4 Default Gateway.
- d. If desired, enter the IPv6 Default Gateway.
- e. Change the MTU value as desired.
- f. Enter one or more Name Server(s) and Search Domain(s).
- g. Click Save.

Note: The Vail VM node interface refreshes after the node changes network settings. The interface may display a lost communication error for several seconds.

• To use DHCP to set the IP address,

Note: If you require the Vail VM node to be configured using a DHCP address, Spectra Logic recommends you use your DHCP server to bind the IP address to the Vail VM node.

- **a.** If necessary, using the **IPv4 Mode** drop-down menu, select **DHCP**.
- **b.** If necessary, using the **IPv6 Mode** drop-down menu, select **Automatic**.
- **c.** Configure the DNS settings:
 - To configure the DNS settings automatically, select **DHCP** and click **Save**.
 - To configure DNS settings manually, select **Manual**. Enter one or more **Name Server(s)** and **Search Domain(s)** and click **Save**.
- d. Click Save.
- **Note:** The Vail VM node interface refreshes after the node changes network settings. The interface may display a lost communication error for several seconds.

Configure the Vail VM Node Hostname

The Vail VM node hostname is used as the top level name of the storage endpoint displayed in the Vail management console. Spectra Logic recommends using a name that includes both the location and type of storage.

For example, in the Dallas location, add the storage type as a suffix such as, Dallas-VM1 and Dallas-VM2.

Here is how to configure the hostname:

- **1.** In the upper right corner of the Vail management console, click the **gear icon** and select **Hostname**.
- 2. Under the Hostname banner, click Edit.

Edit Hostname	×
Configure your Hostname Settings	
Hostname	
vail	
	SAVE

Figure 247 The Vail VM Node Edit Hostname screen.

3. Edit the desired **Hostname** and click **Save**.

Note: Only alphanumeric and the dash (-) character are allowed. The hostname is case sensitive.

Configure the SSL Certificate

IMPORTANT

The Spectra Vail application requires that SSL certificate for the Spectra Vail application and the BlackPearl S3 solution are recognized as valid by clients on your DNS network servers.

Here is how to configure SSL certificate:

- 1. In the upper right corner of the Vail management console, click the **gear icon** and select **SSL Certificate**.
- 2. Under the SSL Certificate banner, click Edit.

Configure your SSL Cortifice	to ?	
Configure your SSE Certifica		
Certificate	Private Key	
Passphrase		0

Figure 248 The Vail VM Node Edit SSL Certificate screen.

- **3.** Enter the desired **Certificate** and **Private Key** in PEM format.
- **4.** If necessary, enter the **Passphrase** that was used to encrypt the private key.
- 5. Click Save.

REGISTER A VAIL VM NODE WITH A VAIL SPHERE

Registering a Vail VM node with a Vail sphere allows you to use the node for data storage. Here is how to register a Vail VM node with a Vail sphere:

- 1. In the Vail VM node management console taskbar, click **Dashboard**.
- 2. Under the **Dashboard** banner, click **Activate**.

Activate	×
Sphere Activation Key	
Alternate Endpoint	
Optional. Specifies the endpoint for activation.	
	SUBMIT

Figure 249 The Vail VM Node - Activate screen.

- 3. Enter the Sphere Activation Key provided by Spectra Logic.
- **4.** If necessary, enter the **Alternate Endpoint**.
- **5.** Click **Submit**. After a few moments the Dashboard screen refreshes once activation completes.
- 6. Under the Dashboard banner, click Register With Sphere.

Register with Sphere	×
1 Enter Sphere Credentials —	Select Location Onfirm
Administrator Username	Administrator Password

Please confirm the detai populated fields or exect Note: Latitude and Longitude v Name	ils below. If necess ute another search values are used for the s	ary, you may edit System View map on ti	any pre-

Figure 252 The Register with Sphere - New Location screen.

- To search for a location...
 - **a.** In the **Address Search** field, enter a geographic location. You can enter a full or partial postal address, city, county, province, or country.
 - **b.** Select the correct match from the list.
 - **Note:** If no match is located, try changing the format of the address you entered. For example, use 9th Street in place of Ninth St.
 - **c.** If desired, manually edit the **Name**.

Spectra Logic recommends naming each location after its physical location in the world.

For example, if Vail resources are located in Dallas, use that as the location name if there is only one Vail resource in that city. If there are multiple Vail resources consolidated in the same city, use suffixes to identify each group such as Dallas-HQ, Dallas-Research, or Dallas-Production.

- **d.** Confirm the information is correct and click **Next**.
- To manually enter a location...
 - **a.** Enter the desired **Name**.

Spectra Logic recommends naming each location after its physical location in the world.

For example, if Vail resources are located in Dallas, use that as the location name if there is only one Vail resource in that city. If there are multiple Vail resources consolidated in the same city, use suffixes to identify each group such as Dallas-HQ, Dallas-Research, or Dallas-Production.

- **b.** Enter the **Latitude** and **Longitude** of the location.
- **Notes:** When entering a value for **Latitude**, use positive values for locations north of the equator, and negative values for locations south of the equator.
 - When entering a value for **Longitude**, use positive values for locations east of the prime meridian, and negative values for locations west of the prime meridian.
 - c. Click Next.

- To skip entering a location...
 - **a.** Enter the desired **Name**.

Spectra Logic recommends naming each location after its physical location in the world.

For example, if Vail resources are located in Dallas, use that as the location name if there is only one Vail resource in that city. If there are multiple Vail resources consolidated in the same city, use suffixes to identify each group such as Dallas-HQ, Dallas-Research, or Dallas-Production.

- **b.** Click **Next**.
- **Note:** If you do not enter an address or latitude and longitude, the location displays on the righthand pane of the Vail dashboard, but does not display on the world map.
- **3.** Confirm the information is correct, and click **Register**.

Wait while the Vail VM node registers with the Vail sphere. This may take several minutes, during which time the Vail VM node interface changes to the Vail management console, and may display communication errors.

Select an Existing Location

Here is how to select an existing location:

1. Using the drop-down menu, **Select a Location** where you want to associate the Vail VM node and click **Next**.

Register with Sphere		×	
Credentials	Reset Password	3 Select Location	4 Confirm
Select a Location			•

Figure 253 The Register with Sphere - Select Location screen.

2. Confirm the information is correct, and click **Register**.

Wait while the Vail VM node registers with the Vail sphere. This may take several minutes, during which time the Vail VM node interface changes to the Vail management console, and may display communication errors.

FREQUENTLY ASKED QUESTIONS

This section covers frequently asked questions that help you understand how the Spectra Vail application operates.

Why Do Vail Jobs Show as Canceled in the BlackPearl User Interface?

When the Spectra Vail application requests an object(s) from a BlackPearl S3 solution, it initiates a Start Bulk Get job in the BlackPearl S3 solution. However, the Spectra Vail application has a back-door path to read objects from the BlackPearl cache. The BlackPearl S3 solution is only aware of when objects are read through the front door path. When the Spectra Vail application completes reading the requested object(s) from the BlackPearl cache, it cancels the job on the BlackPearl S3 solution.

What is the Difference Between AWS Linked Buckets and BlackPearl Linked Buckets?

Vail linked buckets allow the Spectra Vail application to connect to an AWS or BlackPearl bucket, and link to the objects in that bucket. These linked buckets are connected to a Vail bucket. With both AWS and BlackPearl linked buckets, any objects that are currently in the bucket become part of the associated Vail bucket when they are linked. Additionally, any objects added to the AWS or BlackPearl bucket after it is linked to Vail also becomes part of the Vail linked bucket.

AWS linked buckets additionally allow objects added to the Vail bucket to be copied to the linked AWS bucket.

Note: A BlackPearl system does not support this feature.

Who Owns Objects Managed by the Vail Sphere?

Objects copied from an external bucket to a Vail bucket are owned by the owner of the Vail bucket, while objects coped to an external bucket are owned by the user with the credentials used when creating the BlackPearl storage for the bucket.

At What Size Must a PUT Job be a Multi-Part Upload?

The upper size limit before an object must be PUT using multi-part upload is 5 GB.

Note: Spectra Logic recommends using multi-part upload for any object over 1 GB.

Why Do I Receive AWS Connectivity Error Messages From Third-Party Software But Not From Vail?

The Spectra Vail application and the BlackPearl Nearline Gateway do not generate error messages when an AWS connection is unavailable. However some third-party applications, such as Rubrik, may generate an error message when this occurs. In most cases, no user action is necessary.

GLOSSARY

BlackPearl System

A BlackPearl S3 solution is used to provide the interface between the Spectra Vail application and tape storage. A BlackPearl system stores data in a local cache before writing to tape media. When data is requested by the Spectra Vail application the BlackPearl system copies data from tape storage to the cache so it can be accessed by the Spectra Vail application. A BlackPearl system can additionally provide storage to disk media, using Online and NAS storage.

Lifecycle

A lifecycle consists of one or more rules that dictate where objects data is stored and the length of time it is stored in each specified storage location. Users control the data placement using placement and deletion rules, and the storage endpoint where those clones are placed. Lifecycle rules are interpreted on a once per day basis, thereby producing a list of content to move. Data is then moved as a background process.

The available storage targets consist of Vail VM nodes, S3 buckets, and BlackPearl[®] systems that are associated with the Spectra Vail application. Users can create up to five rules per lifecycle to govern the movement and location of data. Users can delete rules at any time, and any data movement in progress completes based on the known rules at the time the transaction started.

Storage

A storage destination consists of either disk-based storage provided by a Vail cluster, block storage provided by a Vail VM node, a BlackPearl bucket, a BlackPearl NAS share, or an AWS[®] S3 repository. Disk-based and block storage can utilize the Standard or Standard-Infrequent Access storage classes, while BlackPearl bucket storage on tape can only use the Glacier storage class. AWS repositories can use any storage class.

Storage Classes

Amazon S3 provides multiple storage classes for different use cases. The Spectra Vail application recognizes all storage classes supported by AWS, but only uses storage class types Standard, Standard-Infrequent Access, and Glacier.

The Spectra Vail application makes a best guess regarding where to place data if any other storage class is specified. Lifecycles can be used to transition data from one storage class to another.

Standard (SA)

This storage class is best for frequently accessed data, as it offers high performance, availability, and data durability, as well as low latency and high throughput. Standard (SA) is fast access storage such as disk, flash, or block storage, as well as Amazon S3 or third-party S3 object storage.

Standard-Infrequent Access (IA)

This storage class is best suited for data that does not need to be accessed frequently, but needs to be retrieved immediately when access is requested. The Standard-IA storage class offers the same low latency, high performance and durability of the Standard storage class, but at lower cost.

Glacier

This storage class is best suited for long-term storage and archiving, as it offers high security and durability at the lowest cost. This storage class is fundamentally different in that in order to access data in Glacier storage, the data must first be retrieved, and this retrieval can take many hours to complete. In order to use this storage class, S3 clients must be able to issue an "object restore" command to move the object from Glacier storage to Standard storage. After the object is available on Standard storage, a GET command is used to access the object.

Vail Bucket

A Vail bucket is the highest-level logical storage container for S3 objects. Each Vail bucket is a unique endpoint and displays a single view of all objects in the bucket, which can have managed copies at multiple sites, in multiple clouds, and in multiple storage classes or tiers.

Vail buckets may be assigned a lifecycle to control the movement of data, but do not require a lifecycle. Multiple Vail buckets can use the same lifecycle. Vail buckets can also be configured to use encryption.

Linked Bucket

The Spectra Vail application is able to link to existing AWS S3 or BlackPearl buckets and create a linked bucket. When this is done the Spectra Vail application is immediately aware of the existing data which allows for ongoing synchronization with external storage targets in the Vail sphere, while still allowing for the application of lifecycle rules.

Only one linked bucket is allowed per storage location.

Location

A Location denotes a physical location in the world that consists of a set of storage targets or physical storage such as a BlackPearl S3 solution, tape storage connected to a BlackPearl S3 solution, Vail VM node storage, and Vail clusters that share the same physical location.

BlackPearl Storage

The Spectra Vail application uses a BlackPearl S3 solution to provide disk storage as an S3 Standard (SA) target, and to optionally provide On-Prem Glacial storage using Spectra Logic tape libraries.

On-Prem Glacier Storage

A BlackPearl S3 solution with On-Prem Glacier storage allows data to move seamlessly into tape storage in a way not previously possible. It enables users to deploy a tier of deep storage that is cost effective, easy to manage, and scalable to exabytes of data.
